Golden Plains Wind Farm Preliminary Offsets Strategy

Author: Anna O'Brien, Offsets Broker, Biodiversity Offsets Victoria

WestWind Energy are proposing to construct the Golden Plains Wind Farm in western Victoria, and need to source suitable native vegetation and threatened species offsets to compensate for the removal of vegetation and habitat associated with the wind farm. The offsets will meet requirements under Victoria's Planning and Environment Act 1987 (P&E Act) and *Permitted clearing and native vegetation – Biodiversity Assessment Guidelines* ('Biodiversity Assessment Guidelines') (DEPI 2013), and the Federal Environmental Protection and Biodiversity Conservation Act 1999 (EPBC Act).

The offset requirements for EPBC Act listed flora, fauna and ecological communities that are likely to be impacted by the proposed wind farm have not yet been determined. These will be determined following the completion of targeted surveys for the relevant EPBC Act listed flora and fauna species by Brett Lane & Associates in June 2017. The targeted species surveys will confirm the likely impacts of the proposed wind farm on Matters of National Environmental Significance (MNES) and inform WestWind Energy's EPBC Act Referral.

The preliminary offset strategy outlines the proposed method to source suitable offsets to meet requirements under the Victorian P&E Act and Biodiversity Assessment Guidelines, and to provide opportunities to meet potential requirements under the EPBC Act once they have been determined.

Native Vegetation Clearance

The proposed Golden Plains Wind Farm covers approximately 17,345 hectares of farming land in the Golden Plains Shire Council, at Barunah Park Farm, Werneth and Rokewood, Victoria. The site is situated in the Victorian Volcanic Plain bioregion and pre-1750 Ecological Vegetation Class (EVC) mapping indicates that the majority of the site would have supported Plains Grassland (EVC 132) vegetation, with smaller areas of Plains Grassy Woodland (EVC 55) vegetation on the higher plains, Plains Grassy Wetland (EVC 125) vegetation in lower-lying areas, and Riparian Woodland (EVC 641), Creekline Grassy Woodland (EVC 68) or Swamp Scrub (EVC 53) along the major drainage lines (DELWP 2017).

The ecology of the proposed wind farm area has been significantly modified through historical farming practices, including annual cropping and grazing, and the removal of bedrock (BLA 2017). The presence and quality of native vegetation is largely dependent on the intensity of agricultural practices. Cropped land or improved pastures generally comprise less or poorer quality native vegetation than areas that have only been grazed, such as the mosaic of rocky outcrops in the south-east half of the site and on roadsides (BLA 2017).

The vegetation assessments undertaken between August 2016 and April 2017 recorded 412.23 hectares of native vegetation through an overview assessment of the south-eastern half of the wind farm and an assessment of the proposed wind farm development footprint in the north-west (BLA 2017). The majority of

the native vegetation recorded (377.15 hectares) was *Heavier-soils* Plains Grassland (EVC 132_61) of low or moderate quality¹. Smaller areas were also recorded of Plains Grassy Wetland (EVC 125) (13.8 hectares), Stony Knoll Shrubland (EVC 649) (10.83 hectares), Non-eucalypt Grassy Woodland (EVC 175_61) (4.74 hectares), Plains Grassy Woodland (EVC 55_61) (3.47 hectares), Creekline Grassy Woodland (EVC 68) (0.35 hectares), Swamp Scrub (EVC 53) (0.02 hectares) and Riparian Woodland (EVC 641) (0.003 hectares). Approximately 12% of all recorded native vegetation was considered of high quality¹.

Some areas of native vegetation also qualify for three EPBC Act listed ecological communities, including *Natural Temperate Grassland of the Victorian Volcanic Plain* (NTGVVP) (252.81 hectares), *Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains* (SHWTLPLP) (4.55 hectares) and *Grassy Eucalypt Woodland of the Victorian Volcanic Plain* (GEWVVP) (2.80 hectares) (BLA 2017). EPBC Act listed flora and fauna species that occur in the wind farm area and are likely to be impacted by its construction are Golden Sun Moth *Synemon plana*, Striped Legless Lizard *Delma impar* and Spiny Rice-flower *Pimelea spinescens*.

Up to 235 wind turbines are proposed for the site, as well as access tracks, underground cabling and other associated infrastructure. The development footprint has been designed and located to avoid or minimise the removal of native vegetation, in particular high quality native vegetation (BLA 2017, see sections 5.4.1 and 5.4.6). Brett Lane & Associates (2017) have determined that the proposed wind farm will result in the loss of 81.29 hectares of native vegetation, which includes 81.009 hectares native vegetation in remnant patches and four scattered trees (equivalent to 0.281 hectares). 46.44 hectares of the native vegetation proposed for removal also qualifies for EPBC Act listed ecological communities. Table 1 below outlines the area of native vegetation proposed for removal.

Table 1. Summary of Proposed Native Vegetation Removal under Victorian and Federal Legislative Requirements

Proposed Native Vegetation Removal under the Victorian P&E Act and Biodiversity Assessment Guidelines	
Risk-based pathway	High
Total Extent	81.290 ha
Remnant Patches	81.009 ha
Scattered Trees	4 trees
Location Risk	C
Proposed Removal of Listed Flora, Fauna and Ecological Communities under the Federal EPBC Act*	
Golden Sun Moth	To be advised
Striped Legless Lizard	To be advised
Spiny Rice-flower	To be advised
Natural Temperate Grassland of the Victorian Volcanic Plain	43.76 hectares
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plans	2.12 hectares
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	0.56 hectares

* Proposed removal of EPBC Act listed flora and fauna habitat will be determined following completion of targeted species surveys in June 2017.

¹ Native Vegetation quality has been determined according to the Site Condition (habitat hectare) Score: 0-25 being of Low quality; 26-50 being of Moderate quality; and 51-75 being of High quality (BLA 2017; DSE 2004; Parkes et al 2003).

Native Vegetation Offset Requirements

A summary of the Victorian offset requirements for the proposed Golden Plains Wind Farm are presented in Table 2 below. The offset requirements for impacts on MNES under Federal EPBC Act will be determined following the completion of targeted surveys and as part of WestWind Energy's EPBC Act Referral submission in June 2017. It is anticipated that the Federal offset requirements will include the protection of areas of NTGVVP, SHWTLP and GEWVVP, habitat for Golden Sun Moths and Striped Legless Lizards, and Spiny Rice-flower plants.

Table 2. Summary of Native Vegetation Offset Requirements under Victorian Legislation

Offset Type	General Offset
General Biodiversity Equivalence Units (BEUs)	2.698 General BEUs
Vicinity	Corangamite Catchment Management Authority or Colac Otway Shire, Golden Plains Shire
Minimum Strategic Biodiversity Score	0.126
Offset Type	Specific Offset
Specific Biodiversity Equivalence Units (BEUs) and threatened species attributes	31.836 Specific BEUs of habitat for Brolga 29.935 Specific BEUs of habitat for Striped Legless Lizard 31.924 Specific BEUs of habitat for Adamson's Blown-grass 22.319 Specific BEUs of habitat for Swamp Sheoak 31.099 Specific BEUs of habitat for Small Milkwort 7.423 Specific BEUs of habitat for Small Scurf-pea 1.083 Specific BEUs of habitat for Button Wrinklewort 31.348 Specific BEUs of habitat for Purple Blown-grass 6.348 Specific BEUs of habitat for White Sunray 31.047 Specific BEUs of habitat for Pale Swamp Everlasting 30.369 Specific BEUs of habitat for Spiny Rice-flower 8.064 Specific BEUs of habitat for Southern Swainson-pea

Offset Market Availability

General and Specific BEUs are available for purchase on Victoria's Native Vegetation Credit Register (NVCR). The NVCR does not currently have sufficient offsets registered to meet the offset requirements of the proposed Golden Plains Wind Farm. Table 3 below outlines the NVCR's current availability relevant to the General and Specific BEUs and attributes required. While the total General BEUs required and Specific BEUs for Small Scurf-pea *Cullen parvum* habitat required can be met through purchasing credits available on the NVCR, the remaining Specific BEUs are not available.

Table 3. Relevant Offsets Currently Available on the NVCR and Shortfall of Offsets required.

General Offset	General BEUs Available	Shortfall of General BEUs		
2.698 General BEUs				
Corangamite Catchment Management Authority or Colac Otway Shire, Golden Plains Shire	Available	0.000		
Minimum Strategic Biodiversity Score of 0.126				
Specific Offset	Threatened Species habitat	Specific BEUs Required	Specific BEUs Available	Shortfall of Specific BEUs
Brolga		31.836	28.209	3.627
Striped Legless Lizard		29.935	18.035	11.9
Adamson's Blown-grass		31.924	17.876	14.048
Swamp Sheoak		22.319	3.829	18.49
Small Milkwort		31.099	14.195	16.904
Small Scurf-pea		7.423	9.823	-2.4
Button Wrinklewort		1.083	0.00	1.083
Purple Blown-grass		31.348	21.727	9.621
White Sunray		6.348	0.427	5.921
Pale Swamp Everlasting		31.047	14.177	16.87
Spiny Rice-flower		30.369	2.916	27.453
Southern Swainson-pea		8.064	4.041	4.023

Source: email advice received from Heather Anderson on behalf of Native Vegetation Credit Register, Department of Environment, Land, Water and Planning, 9 May 2017.

As current market availability cannot meet the proposed Golden Plains Wind Farm offset requirements, WestWind Energy will seek suitable offset sites within or close to the wind farm site that can generate the offsets required, including the likely federal offset requirements. Sites on properties within the proposed wind farm area will be prioritised to locate offsets close to the clearance sites and protect the retained ecological values on site.

Sourcing Suitable Offset Sites

Desktop Offset Site Assessments

Modelled and assessed spatial data for native vegetation, threatened species habitat and wetlands has been used to locate potential offset sites within and adjacent to the wind farm that could generate sufficient General and Specific BEUs, and EPBC Act listed flora and fauna habitat, and ecological communities (Figures 1 and 2). Taxon hot spot mapping for state-listed flora and fauna species illustrates locations where multiple threatened species habitats have been modelled to occur (Figure 1). Modelled wetlands locations illustrate

potential locations for the EPBC Act listed community SHWTL. Native vegetation assessments undertaken previously illustrate known areas of native vegetation, EPBC Act listed NTGVVP, SHWTL and GEWVVP, and suitable habitat for EPBC Act listed Spiny Rice-flower. Suitable habitat for Golden Sun Moth and Striped Legless Lizard occurs throughout the wind farm area in rocky outcrops and native grassland habitats (BLA 2017).

Figures 1 and 2 illustrate the potential offset sites that have been identified in the wind farm host properties as well as in neighbouring properties which support significant offset values, including high numbers of modelled threatened flora or fauna habitats, and assessed or modelled areas of NTGVVP, SHWTL, GEWVVP and Spiny Rice-flower habitat. These landowners have also expressed interest in registering an offset site on their property. The number of potential host and neighbour offset sites identified illustrate that WestWind Energy have multiple on site options to meet their offset requirements. Desktop assessments will be undertaken on all the host and neighbour offset sites identified to determine their potential to meet the Victorian and Federal offset requirements.

Desktop assessments have already been undertaken on two potential offset sites within the wind farm (Potential Offset Sites 1 and 2 respectively, Figures 1 and 2). Estimate offset reports for the potential offsets sites 1 and 2 are provided in Appendices 1 and 2 respectively. Site 1 has the potential to generate sufficient General and Specific BEUs to meet the Victorian offset requirements, with the exception of the Specific BEUs required for habitat for Southern Swainson-pea *Swainsona recta*. If Site 1 is however used in combination with Site 2 and NVCR credits, or with another potential offset area identified, it will likely to meet all the Golden Plains Wind Farm Victorian offset requirements.

It is anticipated that sufficient areas of NTGVVP and SHWTL will be available in the potential host and neighbour offset sites to meet the likely Federal offset requirements (Figure 2). Potential Offset Sites 1 and 2 are estimated to comprise up to 531.27 hectares of NTGVVP and up to 326.7 hectares of SHWTL collectively. If host or neighbour properties do not contain sufficient areas of an appropriate quality of these ecological communities, potential offset sites beyond the proposed wind farm area will be identified. One potential site is Warrambeen, which is located immediately north-east of the proposed wind farm (Figure 2). Warrambeen has up to 322.92 hectares of NTGVVP available and an estimated 10 hectares of unconfirmed SHWTL (*pers. comm.* James Taylor, Warrambeen, 15/5/2017). An offset management update from Warrambeen is provided in Appendix 3.

Vegetation assessments undertaken in the Golden Plains Wind Farm did not locate large areas of the EPBC Act listed GEWVVP within the wind farm that are likely to meet the Federal offset requirements for this ecological community (Figure 2). If retained areas of GEWVVP in the wind farm are not sufficient to meet requirements, potential neighbour offset sites will be investigated as well as sites beyond the proposed wind farm area. One potential site that is known to support GEWVVP, and its landowners have expressed interest, is located east of the wind farm in Bannockburn (Figure 2).

Habitat for EPBC Act listed Striped Legless Lizard and Golden Sun Moth has been recorded throughout the Golden Plains Wind Farm area in rocky outcrops and native grassland habitats (BLA 2017). Targeted surveys for EPBC Act listed Spiny Rice-flower will be completed in June 2017, and will determine the likely impact of the proposed wind farm on this species. Offset requirements for the permitted removal or disturbance of

Striped Legless Lizard, Golden Sun Moth and Spiny Rice-flower habitats will be determined as part of the EPBC Act Referral process. It is anticipated that sufficient areas of suitable habitat are available within the potential host and neighbour offset sites to meet the likely offset requirements for these Federally listed species (Figure 2). Potential Offset Sites 1 and 2 are estimated to comprise up to 531.27 hectares of suitable habitat for Spiny Rice-flower and up to 523.15 hectares of suitable habitat for Golden Sun Moth and Striped Legless Lizard. If host or neighbour properties do not contain suitable habitat, potential sites beyond the proposed wind farm area will be identified. Warrambeen has approximately 322.92 hectares of confirmed habitat for Golden Sun Moth, at least 15 hectares of confirmed habitat for Striped Legless Lizard and approximately 40 recorded Spiny Rice-flower plants (*pers. comm.* James Taylor, Warrambeen, 15/5/2017; Appendix 3).

Offset Site Field Assessments

Potential offset sites will be assessed by an accredited site assessor registered with the Department of Environment, Land, Water and Planning (DELWP). The offset site field assessments will confirm the offset values that may be generated at each site through agreed protection and management actions. Potential offset sites on wind farm host properties will be prioritised to locate offsets close to the clearance sites and protect retained ecological values on site. If sufficient offset values are not available within the wind farm area, potential neighbour offset sites will be assessed, followed by sites further afield, including Warrambeen and the GEWVVP site in Bannockburn.

Secure Suitable Offset Sites

Suitable offsets sites will be secured in perpetuity through an appropriate on-title agreement in negotiation with the relevant landowners and referral authority. Landowners will be advised of the opportunities and implications of establishing an offset site on their property. As well as purchasing offsets, WestWind Energy will explore opportunities to purchase land associated with the wind farm area to meet their offset requirements. Purchased land may be secured and managed to generate required offsets as part of the wind farm operations and provide research and education opportunities to the local community, schools, universities and other visitors.

Conclusion

81.29 hectares of predominantly low to medium quality native vegetation and habitat is proposed for removal as part of the Golden Plains Wind Farm. Offsets that meet Victorian and Federal biodiversity conservation objectives are required to compensate for the proposed loss of native vegetation and threatened species habitat. The offsets required are not currently available in the Victorian Offsets Market. Potential offsets sites have however been identified within wind farm host and neighbouring properties, and are likely to meet all offset requirements. Further desktop and field assessments will be undertaken on these sites to confirm offset availability. If these sites do not meet all requirements, suitable sites are also available at Warrambeen and Bannockburn.

Site gain in habitat hectares

Site gain in habitat hectares is calculated for each biodiversity class area (BCA) in the offset site using the extent and site gain per hectare scores in the GIS data provided.

BCA	Site gain per hectare*	Extent (ha)	Site gain in habitat hectares
1	0.250	1.799	0.450
2	0.250	1.688	0.422
3	0.250	1.597	0.399

Potential Offset site details

BCA	Site gain per hectare*	Extent (ha)	Site gain in habitat hectares
122	0.250	1.688	0.422
TOTAL			90.868

* This value has been calculated using the site gain per hectare values for each habitat zone as provided with the GIS file of the offset site. The site gain per hectare value for a BCA is calculated from the weighted average of site gain per hectare values for all habitat zones that intersect with the BCA.

Scenario Testing Only

Potential Offset site details

Offset site biodiversity equivalence unit calculations by biodiversity class area

The general biodiversity equivalence units for the biodiversity class area are calculated by multiplying the site gain in habitat hectares by the strategic biodiversity score.

Where a BCA has specific units for one or more rare or threatened species, the specific biodiversity equivalence units for each BCA is calculated by multiplying the site gain in habitat hectares by the habitat importance score for each of these species.

BCA	Site gain in habitat hectares	Offset type	General offset attributes	Specific offset attributes		Biodiversity equivalence units*
			Strategic biodiversity score	Species number, Species common name, Species scientific name	Habitat Importance Score

Potential Offset site details

***Note that biodiversity equivalence units within a BCA are alternates. The use of any biodiversity equivalence units of one type within a BCA will result in a proportional reduction in biodiversity equivalence units of other types within that BCA.**

Next steps

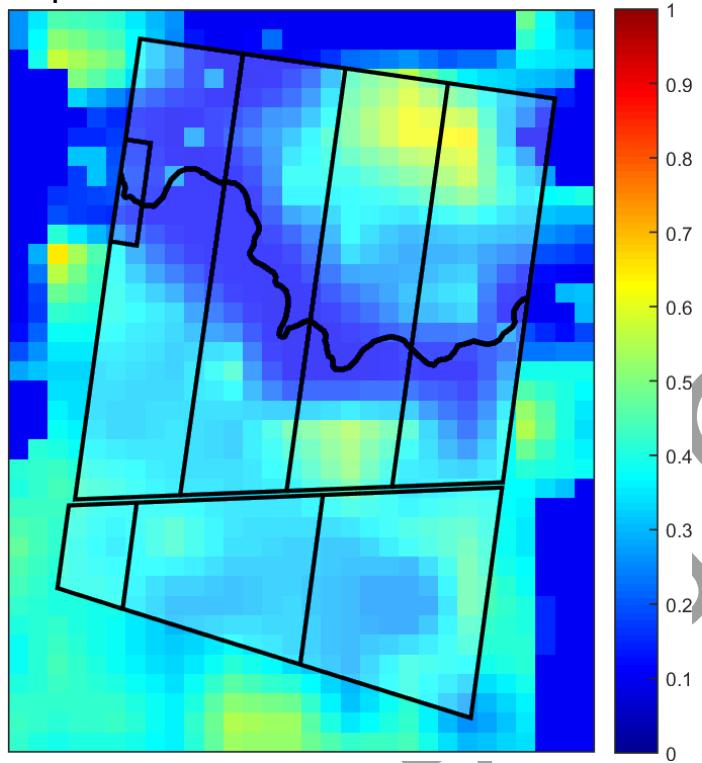

All offset sites must meet eligibility criteria as outlined in the *Native vegetation gain scoring manual, version 1* available on the DELWP website and any other relevant requirements. Eligible offset sites that are intended to be banked or sold as credits must be registered on the native vegetation credit register. A habitat hectare assessment is required to be undertaken before any offset can be registered on the credit register. Once the extent of the proposed offset area is finalised, submit your data standard compliant shapefiles by email to nativevegetation.support@delwp.vic.gov.au for processing.

Glossary

Alternate offset types	Offset types within a biodiversity class area (BCA) are alternates. The use of one offset type will result in the proportional reduction of all other offset types within the BCA. For example, in a BCA that has 1 general unit and 2 specific units for a particular rare or threatened species, if all of the general units are used (100 per cent) there will be no specific units remaining, as these specific units will also reduce by 100 per cent. Alternatively, if in this same BCA only half the general units were used (50 per cent) then there will be 0.5 general units and 1 specific units remaining, half the original values.
Biodiversity Class Area (BCA)	The BCA is the organisational unit of an offset site. BCAs are determined by the unique combination of general and specific biodiversity equivalence units calculated across the offset site.
Condition score	This is the site-assessed condition score for the native vegetation. Each habitat zone in the offset site is assigned a condition score according to the habitat hectare assessment method. This information has been provided by or on behalf of the applicant in the GIS file submitted for processing.
General biodiversity equivalence units (general units)	The general biodiversity equivalence units (general units) quantify the relative overall contribution that the protection and management of native vegetation at the offset site makes to Victoria's biodiversity. The general biodiversity equivalence units is calculated as follows: <i>General biodiversity equivalence units = site gain in habitat hectares × strategic biodiversity score</i>
General offset attributes	The attributes of a general offset site must match those in an offset requirement that is a condition on a permit to remove native vegetation, in order for that offset site to be used to satisfy the permit condition. General offsets must be located in the same Catchment Management Authority boundary or Municipal District (local council) as the clearing site. They must also have a strategic biodiversity score that is at least 80 per cent of the clearing site. The strategic biodiversity score of a general offset is determined by the biodiversity class area the units are sold from.
Habitat importance score	The habitat importance score is a measure of the relative importance of the habitat located on a site for a particular rare or threatened species, compared to all other habitat for that species. The habitat importance score for a species is a weighted average value calculated from the habitat importance map for that species. The habitat importance score is calculated for each biodiversity class area where the habitat importance map indicates that species habitat occurs and where the protection of habitat across the offset agreement is greater than the threshold test.
Habitat zone	Habitat zone is a discrete contiguous area of native vegetation that: <ul style="list-style-type: none">• is of a single Ecological Vegetation Class• has the same measured condition.
Offset type	There are two types of offsets, general offset and specific offsets. All offset sites can be general offsets. Sites that are mapped as habitat for specific rare or threatened species can be specific offsets for those species habitat.

Potential Offset site details

Site gain in habitat hectares	Site gain in habitat hectares is a site-based measure that combines extent and site gain per hectare of native vegetation at an offset site. The site gain in habitat hectares measures both the current status of native vegetation at a site and the potential site gain from the protection and management of the native vegetation at that site. The condition of a site, or the gain in condition due to protection and management actions are multiplied by the extent (area in hectares) of native vegetation to calculate the site gain in habitat hectares value. For a biodiversity class area the site gain in habitat hectares is determined using the following formula:
	$\text{Site gain in habitat hectares} = \text{total extent (hectares)} \times \text{site gain per hectare}$
Site gain per hectare	This is the site-assessed gain per hectare for the native vegetation based on the agreed management and security commitments. Each habitat zone in the offset proposal is assigned a site gain per hectare according to the habitat hectare assessment and gain scoring methods. This is a number between 0 and 1. This information has been provided by or on behalf of the applicant in the GIS file. These values are aggregated to the level of the BCA in order to calculate offset amounts at the offset site.
Specific offset attributes	The attributes of a specific offset site must match those in an offset requirement that is a condition on a permit to remove native vegetation, in order for that offset site to be used to satisfy the permit condition. Specific offsets must be located in the mapped habitat for the species that has triggered the specific offset requirement.
Specific biodiversity equivalence units (specific units)	Specific biodiversity equivalence units (specific units) are associated with a particular rare or threatened species habitat. The specific biodiversity equivalence units quantifies the relative overall contribution that the protection and management of native vegetation at an offset site makes to the habitat of the relevant rare or threatened species. Specific units are calculated for each species in each biodiversity class area where the result of the threshold test is greater than 0.0025 per cent. Specific units are calculated as follows:
	$\text{Specific biodiversity equivalence units}_{\text{species } x} = \text{site gain in habitat hectares} \times \text{habitat importance score}_{\text{species } x}$
Strategic biodiversity score	This is the weighted average strategic biodiversity score of the marked native vegetation. The strategic biodiversity score has been calculated from the <i>Strategic biodiversity map</i> for each BCA. The strategic biodiversity score of native vegetation is a measure of the native vegetation's importance for Victoria's biodiversity, relative to other locations across the landscape. The <i>Strategic biodiversity map</i> is a modelled layer that prioritises locations on the basis of rarity and level of depletion of the types of vegetation, species habitats, and condition and connectivity of native vegetation.
Threshold test	By default, a threshold test is applied to offset sites to limit the number of rare or threatened species for which specific biodiversity equivalence units are calculated. This is done to make organising and trading credits more manageable. The test determines if the offset site can generate specific habitat protection for any rare or threatened species above a threshold. The threshold is set at 0.0025 per cent of the total habitat for a species. When the proportion of habitat protected is above the threshold, specific biodiversity equivalence units are calculated for that species.
Total extent (ha) for calculating site gain in habitat hectares	This is the total area of offset site native vegetation in hectares. The total extent of native vegetation is an input to calculating the site gain in habitat hectares at a site and in calculating the total gain in general and specific biodiversity equivalence units.

Appendix 2: Potential Offset Site 2 Estimate Offset Report (Butler)

Potential Offset site details

This report provides information about a potential native vegetation offset site in accordance with the *Permitted clearing of native vegetation – Biodiversity assessment guidelines*. It IS NOT an Offset Site report provided by DELWP. Once a suitable area has been finalised the relevant shapefiles must be submitted to DELWP for processing.

Date of issue: 27/04/2017

Summary of offset site

Total extent	159.680 ha
Remnant patches	159.680 ha
Revegetation	0.000 ha
Number of biodiversity class areas (BCAs)	31
Catchment Management Authority and Municipal district	Corangamite CMA, Golden Plains Shire Council

Summary of biodiversity equivalence units available at offset site

The offset site has the following general and specific biodiversity equivalence units.

General biodiversity equivalence units	19.961 general units*
Specific biodiversity equivalence units	25.819 specific units* of habitat for Brolga 13.353 specific units* of habitat for Australasian Shoveler 16.710 specific units* of habitat for Hardhead 22.795 specific units* of habitat for Black Falcon 26.067 specific units* of habitat for Striped Legless Lizard 15.070 specific units* of habitat for Growling Grass Frog 23.682 specific units* of habitat for Golden Sun Moth 27.059 specific units* of habitat for Adamson's Blown-grass 24.846 specific units* of habitat for Swamp Sheoak 26.465 specific units* of habitat for Small Milkwort 2.135 specific units* of habitat for Trailing Hop-bush 8.059 specific units* of habitat for Clover Glycine 0.705 specific units* of habitat for Small Scurf-pea 26.511 specific units* of habitat for Purple Blown-grass 14.050 specific units* of habitat for White Sunray 26.161 specific units* of habitat for Pale Swamp Everlasting 27.671 specific units* of habitat for Spiny Rice-flower 3.344 specific units* of habitat for Southern Swainson-pea

*Note that some biodiversity equivalence units may be alternates. The use of any biodiversity equivalence units of one type within a BCA will result in a proportional reduction in biodiversity equivalence units of other types within that BCA.

Site gain in habitat hectares

Site gain in habitat hectares is calculated for each biodiversity class area (BCA) in the offset site using the extent and site gain per hectare scores in the GIS data provided.

BCA	Site gain per hectare*	Extent (ha)	Site gain in habitat hectares
1	0.250	25.313	6.328
2	0.250	5.063	1.266
3	0.250	1.624	0.406
4	0.250	6.750	1.688
5	0.250	1.125	0.281

Potential Offset site details

BCA	Site gain per hectare*	Extent (ha)	Site gain in habitat hectares
6	0.250	3.335	0.834

30	0.250	1.688	0.422
31	0.250	3.938	0.984
TOTAL			39.920

* This value has been calculated using the site gain per hectare values for each habitat zone as provided with the GIS file of the offset site. The site gain per hectare value for a BCA is calculated from the weighted average of site gain per hectare values for all habitat zones that intersect with the BCA.

Potential Offset site details

Offset site biodiversity equivalence unit calculations by biodiversity class area

The general biodiversity equivalence units for the biodiversity class area are calculated by multiplying the site gain in habitat hectares by the strategic biodiversity score.

Where a BCA has specific units for one or more rare or threatened species, the specific biodiversity equivalence units for each BCA is calculated by multiplying the site gain in habitat hectares by the habitat importance score for each of these species.

BCA	Site gain in habitat hectares	Offset type	General offset attributes	Specific offset attributes		Biodiversity equivalence units*
			Strategic biodiversity score	Species number, Species common name, Species scientific name	Habitat Importance Score

		Specific		504581, White Sunray, <i>Leucochrysum albicans var. tricolor</i>	0.669	0.658 specific units
		Specific		504655, Pale Swamp Everlasting, <i>Coronidium scorpioides 'aff. rutidolepis' (Lowland Swamps)' variant</i>	0.623	0.613 specific units
		Specific		504823, Spiny Rice-flower, <i>Pimelea spinescens subsp. spinescens</i>	0.656	0.645 specific units

*Note that biodiversity equivalence units within a BCA are alternates. The use of any biodiversity equivalence units of one type within a BCA will result in a proportional reduction in biodiversity equivalence units of other types within that BCA.

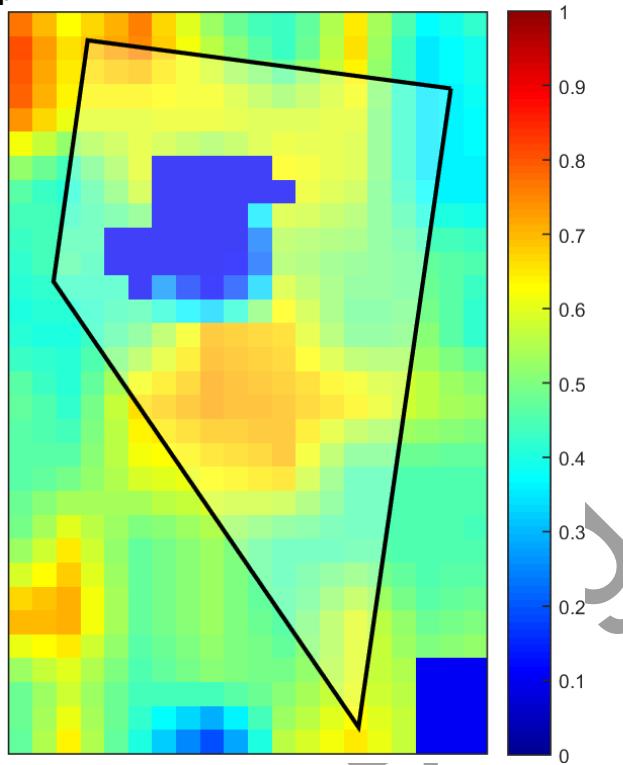

Next steps

All offset sites must meet eligibility criteria as outlined in the *Native vegetation gain scoring manual, version 1* available on the DELWP website and any other relevant requirements. Eligible offset sites that are intended to be banked or sold as credits must be registered on the native vegetation credit register. A habitat hectare assessment is required to be undertaken before any offset can be registered on the credit register. Once the extent of the proposed offset area is finalised, submit your data standard compliant shapefiles by email to nativevegetation.support@delwp.vic.gov.au for processing.

Glossary

Alternate offset types	Offset types within a biodiversity class area (BCA) are alternates. The use of one offset type will result in the proportional reduction of all other offset types within the BCA. For example, in a BCA that has 1 general unit and 2 specific units for a particular rare or threatened species, if all of the general units are used (100 per cent) there will be no specific units remaining, as these specific units will also reduce by 100 per cent. Alternatively, if in this same BCA only half the general units were used (50 per cent) then there will be 0.5 general units and 1 specific units remaining, half the original values.
Biodiversity Class Area (BCA)	The BCA is the organisational unit of an offset site. BCAs are determined by the unique combination of general and specific biodiversity equivalence units calculated across the offset site.
Condition score	This is the site-assessed condition score for the native vegetation. Each habitat zone in the offset site is assigned a condition score according to the habitat hectare assessment method. This information has been provided by or on behalf of the applicant in the GIS file submitted for processing.
General biodiversity equivalence units (general units)	The general biodiversity equivalence units (general units) quantify the relative overall contribution that the protection and management of native vegetation at the offset site makes to Victoria's biodiversity. The general biodiversity equivalence units is calculated as follows: <i>General biodiversity equivalence units = site gain in habitat hectares × strategic biodiversity score</i>
General offset attributes	The attributes of a general offset site must match those in an offset requirement that is a condition on a permit to remove native vegetation, in order for that offset site to be used to satisfy the permit condition. General offsets must be located in the same Catchment Management Authority boundary or Municipal District (local council) as the clearing site. They must also have a strategic biodiversity score that is at least 80 per cent of the clearing site. The strategic biodiversity score of a general offset is determined by the biodiversity class area the units are sold from.
Habitat importance score	The habitat importance score is a measure of the relative importance of the habitat located on a site for a particular rare or threatened species, compared to all other habitat for that species. The habitat importance score for a species is a weighted average value calculated from the habitat importance map for that species. The habitat importance score is calculated for each biodiversity class area where the habitat importance map indicates that species habitat occurs and where the protection of habitat across the offset agreement is greater than the threshold test.
Habitat zone	Habitat zone is a discrete contiguous area of native vegetation that: <ul style="list-style-type: none">• is of a single Ecological Vegetation Class• has the same measured condition.
Offset type	There are two types of offsets, general offset and specific offsets. All offset sites can be general offsets. Sites that are mapped as habitat for specific rare or threatened species can be specific offsets for those species habitat.

Potential Offset site details

Site gain in habitat hectares	Site gain in habitat hectares is a site-based measure that combines extent and site gain per hectare of native vegetation at an offset site. The site gain in habitat hectares measures both the current status of native vegetation at a site and the potential site gain from the protection and management of the native vegetation at that site. The condition of a site, or the gain in condition due to protection and management actions are multiplied by the extent (area in hectares) of native vegetation to calculate the site gain in habitat hectares value. For a biodiversity class area the site gain in habitat hectares is determined using the following formula:
	$\text{Site gain in habitat hectares} = \text{total extent (hectares)} \times \text{site gain per hectare}$
Site gain per hectare	This is the site-assessed gain per hectare for the native vegetation based on the agreed management and security commitments. Each habitat zone in the offset proposal is assigned a site gain per hectare according to the habitat hectare assessment and gain scoring methods. This is a number between 0 and 1. This information has been provided by or on behalf of the applicant in the GIS file. These values are aggregated to the level of the BCA in order to calculate offset amounts at the offset site.
Specific offset attributes	The attributes of a specific offset site must match those in an offset requirement that is a condition on a permit to remove native vegetation, in order for that offset site to be used to satisfy the permit condition. Specific offsets must be located in the mapped habitat for the species that has triggered the specific offset requirement.
Specific biodiversity equivalence units (specific units)	Specific biodiversity equivalence units (specific units) are associated with a particular rare or threatened species habitat. The specific biodiversity equivalence units quantifies the relative overall contribution that the protection and management of native vegetation at an offset site makes to the habitat of the relevant rare or threatened species. Specific units are calculated for each species in each biodiversity class area where the result of the threshold test is greater than 0.0025 per cent. Specific units are calculated as follows:
	$\text{Specific biodiversity equivalence units}_{\text{species } x} = \text{site gain in habitat hectares} \times \text{habitat importance score}_{\text{species } x}$
Strategic biodiversity score	This is the weighted average strategic biodiversity score of the marked native vegetation. The strategic biodiversity score has been calculated from the <i>Strategic biodiversity map</i> for each BCA. The strategic biodiversity score of native vegetation is a measure of the native vegetation's importance for Victoria's biodiversity, relative to other locations across the landscape. The <i>Strategic biodiversity map</i> is a modelled layer that prioritises locations on the basis of rarity and level of depletion of the types of vegetation, species habitats, and condition and connectivity of native vegetation.
Threshold test	By default, a threshold test is applied to offset sites to limit the number of rare or threatened species for which specific biodiversity equivalence units are calculated. This is done to make organising and trading credits more manageable. The test determines if the offset site can generate specific habitat protection for any rare or threatened species above a threshold. The threshold is set at 0.0025 per cent of the total habitat for a species. When the proportion of habitat protected is above the threshold, specific biodiversity equivalence units are calculated for that species.
Total extent (ha) for calculating site gain in habitat hectares	This is the total area of offset site native vegetation in hectares. The total extent of native vegetation is an input to calculating the site gain in habitat hectares at a site and in calculating the total gain in general and specific biodiversity equivalence units.

Appendix 3: Warrambeen Offset Capability Report

Warrambeen Offset Management Update.

May, 2017.

Warrambeen is a family farm located 45 minutes drive West of Geelong and South of Ballarat, between Rokewood and Shelford. The farm consists of large tracts of untouched native grassland areas, which in the last decade have become recognised as high quality locations for a range of State and Federal Offsets.

Credentials

Warrambeen is successfully managing over 200 hectares of native grassland for a range of proponents to achieve outcomes for both flora and fauna. With an interest in environmental preservation that started with Ian and Trish Taylor in the early 90's the Taylor family has an ongoing commitment to preserving these diverse and rare tracts of land and the flora and fauna that inhabit them.

Offset Management

Each Offset Management Plan details the objectives and outcomes that need to be achieved. We have a robust and proven strategy involving crash grazing of sheep and spot spraying for weed control, pest control and detailed tracking and reporting of plan activities for proponents and relevant Government departments. Further information is available on request.

Client Contact

Please see following page for list of available offset. For further information on land we have available for State and Federal offsets please contact:

James Taylor / Lee Evans, Offset Managers. Warrambeen / Gumley. Ph: 03 52813329, Mob. 0400 331 588 / Email: offsets@warrambeen.com

Summary Table: Offset Availability	Volcanic Plains Grassland Hectares Available	Creekline Tussock / Stony Knoll Shrubland Hectares Available	Veg. Significance	Grasslands Survey Status	GSM Status	GSM Comments
Gumley - Group 1, East Creek and Saxon	66.92	-	Very High	Surveyed	Very High	GSM surveyed & status confirmed
Gumley - Group 2, 860 Paddock	152	-	Very High	Part Surveyed (70 HA)	Very High	GSM sited by landowner many times adjoins confirmed GSM at South and North Ends
Warrambeen. Group 3, Creek Paddock & Wooly areas	74	TBA	Very High	Surveyed	High	GSM Surveyed, status confirmed (72.06 HA), remaining area rated as likely.
Warrambeen Group 4, North Woolshed Hill	30	15 HA Crk / 30.5 S.KN	Very High	Surveyed	Very High	GSM surveyed & status confirmed

This list includes surveyed areas, additional areas are available and not yet surveyed.

What types of vegetation offsets are available?

VEGETATION

- Volcanic Plains Grassland (Very High Quality)
- Creekline Tussock Grassland
- Stony Knoll Shrubland
- Plains Grassy Wetland
- Spiny Rice Flower

FAUNA

- Striped Legless Lizard
- Golden Sun Moth
- Growling Grass Frog.

Each of the vegetation types have been identified and surveyed by independent Ecological Consultants. Warrambeen has surveyed land available for offsets. Additional areas are surveyed during Spring and can be arranged to suit an anticipated need.
