1. Executive summary

Ricardo Energy, Environment & Planning engaged Nature Advisory Pty Ltd to conduct a flora and fauna assessment of a 160-hectare area of land in Fulham. The specific area investigated, herein referred to as the 'study area', was bounded by Hopkins Road to the east, McLarens Road to the south and private property to the north and west. Development of a solar energy facility is proposed for the study area.

The study area was dominated by introduced pasture grasses, while approximately one quarter of the study area supported native vegetation in the form of highly modified woodland, and to a lesser extent, highly modified swamp scrub swamp vegetation that was concentrated in the north-eastern, south-eastern and south-western parts of the study area. Similar native vegetation but of a higher quality occurred in small patches along the roadsides of Hopkins Road and McLarens Road.

Fauna habitat in the study area consisted of grass-dominated vegetation, and comparatively small areas of planted treed vegetation and wetland habitats.

No flora, fauna or ecological communities listed under the EPBC Act or FFG Act were recorded and there are no implications under either of these Acts for the proposed development.

The following native vegetation was recorded in the study area:

- A total of 19 patches of native vegetation (absent of large trees), equating to a total extent of 29.330 hectares that comprised the following:
 - 13 patches of highly modified Plains Grassy Woodland (EVC 55), equating to an extent of 28.795 hectares; and
 - 6 patches of highly modified Swamp Scrub vegetation (EVC 53), equating to an extent of 0.535 hectares.

DELWP-mapped wetlands were also present within the study area. these are considered as native vegetation for the purposes of this assessment.

The currently proposed footprint will result in the loss of all of the native vegetation present except for some in the southeast. A total extent of 27.878 hectares of native vegetation, comprising 27.714 hectares of patch vegetation and 0.164 hectares of DELWP mapped wetlands, will be removed.

A permit under Clause 52.17 of the Wellington Planning Scheme is required for the removal of native vegetation.

The assessment pathway is determined by the location category and extent of native vegetation as detailed for the study area as follows:

- Location Category: Location 2
- Extent of native vegetation: A total of 27.878 hectares of native vegetation (including no large trees).

Based on these details, the Guidelines stipulate that the proposal is to be assessed under the Detailed assessment pathway.

This proposal would trigger a referral to DELWP based on the criteria specified in Section 3.3.3.

Offsets required to compensate for the proposed removal of native vegetation from the study area are provided below.

- 8.180 general habitat units and must include the following offset attribute requirements:
 - Minimum strategic biodiversity value (SBV) of 0.373.
 - Occur within the West Gippsland CMA boundary or the Wellington municipal district.

Under the Guidelines all offsets must be secured prior to the removal of native vegetation.

The offset target for the current proposal will be achieved via a third-party offset.

There are no implications for the proposed development in regards to the FFG Act and EPBC Act.

A referral will be required under the EE Act.

The table below summarises the compliance of the information in this report with the application requirements of the *Guidelines for the removal, destruction or lopping of native vegetation* (DELWP 2017a).

| | Application requirement | Response |
|----|--|-----------------------------------|
| 1. | Information about the native vegetation to be removed | See Section 5.2 of this report. |
| 2. | Topographic and land information relating to the native vegetation to be removed | See Section 5.1 of this report. |
| 3. | Recent, dated photographs of the native vegetation to be removed | See Appendix 4 of this report. |
| 4. | Details of any other native vegetation approved to be removed, or that was removed without the required approvals, on the same property or on contiguous land in the same ownership as the applicant, in the five-year period before the application for a permit is lodged | N/A |
| 5. | An avoid and minimise statement | See Section 7.2.1 of this report. |
| 6. | A copy of any Property Vegetation Plan contained within an agreement made pursuant to section 69 of the <i>Conservation, Forests and Lands Act 1987</i> that applies to the native vegetation to be removed | N/A |
| 7. | Where the removal of native vegetation is to create defendable space, a written statement explaining why the removal of native vegetation is necessary. This statement is not required when the creation of defendable space is in conjunction with an application under the Bushfire Management Overlay. | N/A |
| 8. | If the application is under Clause 52.16, a statement that explains how the proposal responds to the Native Vegetation Precinct Plan considerations (at decision guideline 8). | N/A |

| | Application requirement | Response |
|----|--|--------------------------------|
| 9. | An offset statement providing evidence that an offset that meets the offset requirements for the native vegetation to be removed has been identified and can be secured in accordance with the Guidelines | See Appendix 7 of this report. |

| Additional requirements for applications in the Detailed assessment pathway | | | | | |
|---|---|--|--|--|--|
| | Application requirement | Response | | | |
| | A site assessment report of the native vegetation to be removed, including: | See Section 5.2.1, Appendix 2 and Appendix 6 of this report. | | | |
| | A habitat hectare assessment of any patches of native vegetation, including the condition, extent (in hectares), Ecological Vegetation Class and bioregional conservation status. | | | | |
| 10. | The location, number, circumference (in centimetres measured at 1.3 metres above ground level) and species of any large trees within patches | | | | |
| | The location, number, circumference (in centimetres measured at 1.3 metres above ground level) and species of any scattered trees, and whether each tree is small or large. | | | | |
| | Information about impacts on rare or threatened species habitat, including: | See Appendix 6 of this report. | | | |
| | The relevant section of the Habitat importance map for each rare or threatened species requiring a species offset. | | | | |
| 11. | For each rare or threatened species that the native vegetation to be removed is habitat for, according to the Habitat importance maps: | | | | |
| | the species' conservation status | | | | |
| | the proportional impact of the removal of native vegetation on the total habitat for that species | | | | |
| | whether their habitats are highly localised habitats, dispersed habitats, or important areas of habitat within a dispersed species habitat. | | | | |

2. Introduction

Ricardo Energy, Environment & Planning engaged Nature Advisory Pty Ltd to conduct a flora and fauna assessment of a 160-hectare area of land in Fulham. The specific area investigated, herein referred to as the 'study area', was bounded by Hopkins Road to the east, McLarens Road to the south and private property to the north and west. Development of a solar energy facility is proposed for the study area.

This investigation was commissioned to provide information on the extent and condition of native vegetation in the study area according to Victoria's *Guidelines for the removal, destruction or lopping of native vegetation* (DELWP 2017a), herein referred to as 'the Guidelines', and any potential impacts on flora and fauna matters listed under the state *Flora and Fauna Guarantee Act* 1988 (FFG Act) and the Commonwealth *Environment Protection and Biodiversity Conservation Act* 1999 (EPBC Act). This report outlines any implications under relevant national, state and local legislation and policy frameworks.

Specifically, the scope of the investigation included the following:

- A review of existing information on the flora, fauna and native vegetation of the study area and surrounds, including the following:
 - The Victorian Biodiversity Atlas administered by the Department of Environment, Land, Water and Planning (DELWP);
 - The Commonwealth Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) Protected Matters Search Tool; and
 - DELWP's Native Vegetation Information Management system (NVIM).
- A site survey involving the following:
 - Characterisation and mapping of native vegetation on the site, as defined in the Guidelines;
 - Assessment of native vegetation in accordance with the Guidelines, including habitat hectare assessment;
 - Compilation of flora species list for the site;
 - Assessment of the nature and quality of native fauna habitat; and
 - Assessment of the likelihood of occurrence of EPBC Act- and FFG Act-listed flora, fauna and communities on the site.

This report is divided into the following sections:

Section 3 provides the legislative background including details of all relevant Commonwealth, State and local legislation and policies.

Section 4 describes the sources of information, including the methods used for the field survey.

Section 5 presents the assessment results, including details of the native vegetation, flora and fauna of the study area.

Section 6 discusses the proposed impacts of the project.

Section 7 details the implications of the findings under the relevant legislation and policy.

This investigation was undertaken by a team from Nature Advisory comprising Annette Cavanagh (Botanist), Guille Mayor (Ecologist), Verity Fyfe (Senior Ecologist), Nhung Nguyen (Senior GIS Analyst) and Gael Campbell-Young (Senior Ecologist and Project Manager).

3. Planning and legislative considerations

This investigation and report address the applications of relevant legislation and planning policies that protect biodiversity on the site. Local, state and Commonwealth controls are summarised below.

3.1. Local planning provisions

The study area is located within the Wellington local government area and currently zoned Farming Zone in the Wellington Planning Scheme.

The study area is located within a Bushfire-prone Area.

Local planning provisions apply under the Victorian Planning and Environment Act 1987.

3.2. Overlays

No overlays cover the study area.

3.3. State planning provisions

State planning provisions are established under the Victorian Planning and Environment Act 1987.

Clause 52.17 of all Victorian Planning Schemes states that:

A permit is required to remove, destroy or lop native vegetation, including dead native vegetation.

A permit is not required if:

- An exemption in Table 52.17-7 specifically states that a permit is not required.
- A native vegetation precinct plan corresponding to the land is incorporated into the planning scheme and listed in the schedule to Clause 52.16.
- The native vegetation is specified in a schedule to Clause 52.17.

3.3.1. Exemptions

No exemptions to Clause 52.17 are relevant to this project.

3.3.2. Application requirements

Any application to remove, destroy or lop native vegetation must comply with the application requirements specified in the Guidelines (DELWP 2017a).

When assessing an application, Responsible Authorities are also obligated to refer to Clause 12.01-2 (Native vegetation management) in the Planning Scheme that refers to the following in addition to the Guidelines:

- Assessor's handbook applications to remove, destroy or lop native vegetation (Version 1.1) (DELWP 2018a).
- Statewide biodiversity information maintained by DELWP.

The application of the Guidelines (DELWP 2017a) is explained further in Appendix 1.

3.3.3. Referral to DELWP

Clause 66.02-2 of the planning scheme determines the role of DELWP in the assessment of native vegetation removal permit applications. If an application is referred, DELWP may make certain recommendations to the responsible authority in relation to the permit application.

Any application to remove, destroy or lop native vegetation must be referred to DELWP if:

- The impacts to native vegetation are in the Detailed Assessment Pathway;
- A property vegetation plan applies to the site; or
- The native vegetation is on Crown land that is occupied or managed by the responsible authority.

3.4. EPBC Act

The *Environment Protection and Biodiversity Conservation Act* 1999 (EPBC Act) protects a number of threatened species and ecological communities that are considered to be of national conservation significance. Any significant impacts on these species require the approval of the Australian Minister for the Environment.

If there is a possibility of a significant impact on nationally threatened species or communities or listed migratory species, a Referral under the EPBC Act should be considered. The Minister will decide after 20 business days whether the project will be a 'controlled action' under the EPBC Act, in which case it cannot be undertaken without the approval of the Minister. This approval depends on a further assessment and approval process (lasting between three and nine months, depending on the level of assessment).

Implications under the EPBC Act for the current proposal are discussed in Section 7.3.

3.5. FFG Act

The Victorian *Flora and Fauna Guarantee Act* 1988 (FFG Act) lists threatened and protected species and ecological communities (DELWP 2018b, DELWP 2017b). Any removal of protected flora, that includes threatened flora species and the plants that make up threatened communities, listed under the FFG Act from public land requires a Protected Flora Licence or Permit under the Act, obtained from DELWP.

The FFG Act only applies to private land where a license is required to remove grass trees, tree ferns and sphagnum moss for sale, or where an Interim Conservation Order has been made to protect critical habitat for a threatened species or community. No such habitat has ever been declared, therefore this mechanism under the FFG Act has never been implemented.

Implications under the FFG Act for the current proposal are discussed in Section 7.4.

3.6. EE Act

One or a combination of a number of criteria may trigger a requirement for a Referral to the Victorian Minister for Planning who will determine if an Environmental Effects Statement (EES) is required according to the *Ministerial Guidelines for Assessment of Environmental Effects under the* Environment Effects Act 1978 (DSE 2006).

The criteria related to flora, fauna and native vegetation that trigger a Referral are outlined below.

<u>One or more</u> of the following would trigger a Referral:

- Potential clearing of 10 hectares or more of native vegetation from an area that:
 - Is of an Ecological Vegetation Class identified as endangered by the Department of Sustainability and Environment (in accordance with Appendix 2 of Victoria's Native Vegetation Management Framework); or

- Is, or is likely to be, of very high conservation significance (as defined in accordance with Victoria's Native Vegetation Management Framework); and
- Is not authorised under an approved Forest Management Plan or Fire Protection Plan.
- Potential long-term loss of a significant proportion (e.g. 1 to 5 percent depending on the conservation status of the species) of known remaining habitat or population of a threatened species within Victoria
- Potential long-term change to the ecological character of a wetland listed under the Ramsar Convention or in 'A Directory of Important Wetlands in Australia'
- Potential extensive or major effects on the health or biodiversity of aquatic, estuarine or marine ecosystems, over the long term

<u>Two or more</u> of the following would also trigger a Referral:

- Potential clearing of 10 hectares or more of native vegetation, unless authorised under an approved Forest Management Plan or Fire Protection Plan
- Matters listed under the Flora and Fauna Guarantee Act 1988:
 - Potential loss of a significant area of a listed ecological community; or
 - Potential loss of a genetically important population of an endangered or threatened species (listed or nominated for listing), including as a result of loss or fragmentation of habitats; or
 - Potential loss of critical habitat; or
 - Potential significant effects on habitat values of a wetland supporting migratory bird species.

Implications under the *Environment Effects Act* 1978 (EE Act) for the current proposal are discussed in Section 7.5.

3.7. CaLP Act

The Catchment and Land Protection Act 1994 (CaLP Act) requires that landowners (or a third party to whom responsibilities have been legally transferred) must eradicate regionally prohibited weeds and prevent the growth and spread of regionally controlled weeds.

Weed species listed in the CaLP Act that have been recorded in the study area are discussed in Section 7.6.

4. Existing information and methods

4.1. Existing information

Existing information used for this investigation is described below.

4.1.1. Existing reporting and documentation

The existing documentation below, relating to the study area was reviewed.

Wellington Planning Scheme

4.1.2. Native vegetation

Pre-1750 (pre-European settlement) vegetation mapping administered by DELWP was reviewed to determine the type of native vegetation likely to occur in the study area and surrounds. Information on Ecological Vegetation Classes (EVCs) was obtained from published EVC benchmarks. These sources included the following:

- Relevant EVC benchmarks for the Gippsland Plain bioregion¹ (DSE 2004a); and
- NatureKit (DELWP 2021a).

4.1.3. Listed matters

Existing flora and fauna species records and information about the potential occurrence of listed matters was obtained from an area termed the 'search region', defined here as an area with a radius of ten kilometres from the approximate centre point of the study area (coordinates: latitude 38° 06' 58" S and longitude 146° 58' 03" E).

A list of the flora and fauna species recorded in the search region was obtained from the *Victorian Biodiversity Atlas* (VBA), a database administered by DELWP.

The online EPBC Act *Protected Matters Search Tool* (DAWE 2021a) was consulted to determine whether nationally listed species or communities potentially occurred in the search region based on habitat modelling.

4.2. Field methods

Field assessments were conducted on 26 and 27 August, and 29 and 30 October 2020. During these assessments, the study area was initially surveyed by vehicle and areas supporting native vegetation and/or fauna habitat were inspected in more detail on foot.

Sites in the study area found to support native vegetation or with potential to support listed matters were mapped through a combination of aerial photograph interpretation and ground-truthing using a hand-held GPS (accurate to approximately five metres). Species and ecological communities listed as threatened under the EPBC Act or FFG Act (where they occurred on public land) were also mapped using the same method.

¹ A bioregion is defined as "a geographic region that captures the patterns of ecological characteristics in the landscape, providing a natural framework for recognising and responding to biodiversity values". In general bioregions reflect underlying environmental features of the landscape (DNRE 1997).

4.2.1. Native vegetation

Native vegetation is currently defined in Clause 73.01 of all Victorian planning schemes as 'plants that are indigenous to Victoria, including trees, shrubs, herbs and grasses'. The Guidelines (DELWP 2017a) further classify native vegetation as belonging to two categories:

- Patch; or
- Scattered tree.

The definitions of these categories are provided below, along with the prescribed DELWP methods for assessment. Further details on definitions of patches and scattered trees are provided in Appendix 1.

Patch

A patch of native vegetation is either:

- An area of vegetation where at least 25 per cent of the total perennial understorey plant cover is native; or
- Any area with three or more native canopy trees² where the drip line³ of each tree touches the drip line of at least one other tree, forming a continuous canopy; or
- Any mapped wetland included in the Current wetlands map, available at MapShareVic (DELWP 2021b).

Patch condition is assessed using the habitat hectare method (Parkes *et al.* 2003; DSE 2004b) whereby components of the patch (e.g. tree canopy, understorey and ground cover) are assessed against an EVC benchmark. The score effectively measures the percentage resemblance of the vegetation to its original condition.

The *Native Vegetation Information Management* (NVIM) system (DELWP 2021c) provides modelled condition scores for native vegetation to be used in certain circumstances.

Scattered tree

A scattered tree is:

• A native canopy tree² that does not form part of a patch.

Scattered trees are counted and mapped, the species identified and the circumference at 1.3 metres above the ground is recorded.

4.2.2. Flora species and habitats

Records of flora species were made in conjunction with sampling methods used to undertake habitat hectare assessments of native vegetation described above. Specimens requiring identification using laboratory techniques were collected.

Species protected under the FFG Act were determined by crosschecking against the FFG Act *Protected Flora List* (DELWP 2017b).

³ The drip line is the outermost boundary of a tree canopy (leaves and/or branches) where the water drips on to the ground.

² A native canopy tree is a mature tree (i.e. able to flower) that is taller than three metres and normally found in the upper layer of the relevant vegetation type.

The potential for habitats to support listed flora species was assessed based on the criteria outlined below:

- The presence of suitable habitat for flora species such as soil type, floristic associations and landscape context; and
- The level of disturbance of suitable habitats by anthropogenic disturbances and invasions by pest plants and animals.

Wherever appropriate, a precautionary approach was adopted in determining the likelihood of occurrence or flora listed under the EPBC Act and/or FFG Act. That is, where insufficient evidence was available on the potential occurrence of a listed species, it is assumed that this could be in an area of suitable habitat.

4.2.3. Fauna species and habitats

The techniques below were used to detect fauna species utilising the study area.

- Incidental searches for mammal scats, tracks and signs (e.g. diggings, signs of feeding and nests/burrows).
- Turning over logs/rocks and other ground debris for reptiles, frogs and mammals.
- Daytime bird observations.
- General searches for reptiles and frogs; including identification of frog calls in seasonally wet areas.
- General searches for bat habitat including waterbodies and potential roosting sites such as caves, dead trees with hollows and underneath bark of trees.

Fauna habitats are described using habitat components that include old-growth trees, fallen timber, leaf litter, water bodies and surface rocks.

Habitat connectivity of the study area (i.e. degree of isolation/fragmentation), including linkages to other habitats in the region, was determined using field observations, recent aerial photography and *NatureKit* (DELWP 2021a).

Wherever appropriate, a precautionary approach was adopted in determining the likelihood of occurrence or fauna listed under the EPBC Act and FFG Act. That is, where insufficient evidence was available on the potential occurrence of a listed species, it is assumed that it could be in an area of suitable habitat.

4.2.4. Threatened ecological communities

The study area was assessed against published descriptions of relevant listed ecological communities modelled to potentially occur in the study area.

Reviewed ecological community descriptions comprised identification criteria and condition thresholds from listing advice for EPBC Act communities and FFG Act-listed community descriptions (SAC 2015).

4.3. Limitations of field assessment

Site assessments were carried out in winter and spring. The short duration and seasonal timing of field assessments can result in some species not being detected when these may occur at other times. Additionally, some flora species and life-forms may be undetectable at the time of the survey or unidentifiable due to a lack of flowers or fruit.

Difficulties in identifying flora in its observed state limited the accuracy of determining native vegetation patch extent. The timing of the survey and condition of vegetation was otherwise considered suitable to ascertain the extent and condition of native vegetation and fauna habitats.

These limitations were not considered to compromise the validity of the current investigation that was designed to address the relevant policies and decision guidelines.

Identification of EVCs considers vegetation types that would have naturally occupied the landscape prior to European impacts. Significant past vegetation clearance, and alteration of the study area's landform and hydrology, has resulted in the emergence of an artificial site ecology that is likely to be notably different to what would have naturally occupied the study area. Identification of EVCs in altered areas was therefore based upon consideration of:

- Modelled EVC mapping (DELWP 2021a);
- Any observed indigenous flora species that are useful for determining EVCs; and
- Relevant published EVC benchmark descriptions.

If the above information was not sufficient to allow for a reasonable conclusion to be made regarding which EVC would have naturally occurred and the observed vegetation resembled an EVC that is likely to have naturally occurred in the region, EVC identification was based upon the structure and floristic composition of current observed vegetation.

5. Assessment results

5.1. Site description

The study area for this investigation (Figure 1) consisted of approximately 160 hectares of private land and adjoining roadside located at Hopkins Road, Fulham, approximately eight kilometres west of Sale and 180 kilometres east-south-east of Melbourne's CBD. The study area is bordered by Hopkins Road to the east, McLarens Road to the south, farmland and the Fulham Correctional Centre to the north, and farmland to the west.

The study area supported loamy soils on a relatively flat landscape. A small drainage line ran across the south-eastern corner, and several dams were present throughout, two of which were mapped as DELWP Mapped Wetlands. A house and planted treed vegetation occurred in the east of the study area. The study area has been historically cleared and long been used for stock grazing. Land surrounding the study area was also predominantly used for agriculture.

Vegetation in the study area was dominated by introduced pasture grasses such as Rye Grass, Cocksfoot and Toowoomba Canary-grass, occurring across most of the study area. Approximately one quarter of the study area supported native vegetation consisting of Spear Grass, Wallaby Grass, Rush, Common Blown-grass and Common Wheat-grass. These areas were mostly confined to the north-eastern, south-eastern and south-western corners of the study area. Native vegetation also occurred in small patches along the roadsides of Hopkins Road and McLarens Road. These areas supported native species such as Kangaroo Grass, Common Tussock-grass, Wattle Mat-rush, Common Woodruff and Sheep's Burr.

Fauna habitat within the study area comprised the following:

- Grassland habitat: Most of the study area comprised derived grassland that consisted of both native and non-native species. These areas had been grazed by cattle. The grassland habitat continued into adjacent properties forming a larger core area.
- Wetland habitat: Low-lying areas supporting surface water and a narrow drainage line and farm dams of varying sizes were scattered through the study area. There was minimal fringing vegetation around water bodies due to traffic from stock and erosion. However, these areas may attract some frogs and waterbirds, and provide a drinking spot for birds and other vertebrates.
- Planted vegetation: Several planted trees, such as Pines and Sugar Gums were present at the eastern extent of the study area which may provide roosting sites for birds and arboreal mammals. A dense cover of African Box-thorn in the understorey may also provide cover for ground-dwelling fauna.

The following key fauna habitat areas occurred within the region:

- The Holey Plains State Park occurs approximately 7.5 kilometres south of the study area. Fauna habitat in the study area is isolated from this habitat by pine plantations that occur immediately to the north of the State Park.
- Sale Common, part of the Gippsland Lakes Ramsar Site, was located approximately 10 kilometres east of the study area. Fauna habitat in the study area was connected to this habitat via adjacent properties. There are several minor roads that pass between the study area and the Sale Common, however, these are unlikely to impede fauna movement.

The study area lies within the Gippsland Plain bioregion and falls within the West Gippsland catchment management area.

5.2. Native vegetation

5.2.1. Patches of native vegetation

Pre-European EVC mapping (DELWP 2021a) indicated that the study area and surrounds would have supported Plains Grassy Woodland/Gilgai Wetland Mosaic (EVC 259), Swamp Scrub (EVC 53) and Plains Grassland (EVC 132) prior to European settlement based on modelling of factors including rainfall, aspect, soils and remaining vegetation.

Evidence on site, including floristic composition and soil characteristics, suggested that Plains Grassy Woodland (EVC 55) and Swamp Scrub (EVC 53) were present within the study area (Figure 1). A description of these EVCs is provided within the EVC benchmarks in Appendix 5.

A total of 19 patches (referred to herein as habitat zones) comprising the abovementioned EVCs, were identified in the study area (Table 1). This totalled an area of 29.330 hectares of native vegetation in patches and included no large trees.

| Habitat Zone | EVC | Description |
|-----------------|---------------------------------------|---|
| A, B, C & D | Plains Grassy Woodland (EVC 55) | These were small areas of native vegetation along the roadside. No large trees or canopy trees present. Native understorey included tufted and non-tufted graminoids with an approximate cover of 30%. Typical species present were Spear Grass, Kangaroo Grass, Common Tussock-grass and Common Wheat-grass. There was a low to moderate cover of herbs in some habitat zones (1–10%), attributable to Sheep's Burr and Common Woodruff. Weed cover was approximately 30% and included high-threat Paspalum, Cocksfoot, Yorkshire Fog and Rat-tail Grass. Bryophyte cover was 10% and soil crust cover was 1%. Organic litter cover was 40% and was mostly native in origin. No logs were present. |
| E & F | Swamp Scrub (EVC 53) | Occurring along the roadside, these habitat zones were dominated by Australian Sweet-grass, having a total cover of 50%. A low cover of herbs was also present (4%). This included Sheep's Burr and Crane's Bill. No canopy trees were present. Weed cover was 5% and comprised Toowoomba Canary-grass, Cocksfoot and Cape Weed. No bryophytes or soil crusts were recorded. Organic litter cover was 5%. |
| G | Swamp Scrub (EVC 53) | This habitat zone supported a 25% cover of tufted graminoids (Spear Grass and Kangaroo Grass) and a 30% cover of non-tufted graminoids (Australian Sweet-grass and Common Wheat-grass). No canopy species were present. Weed cover was 30% and included Toowoomba Canary-grass, Cocksfoot, Cape Weed and Couch. There was a 5% cover of bryophytes, and 20% cover of organic litter, however, this was mostly non-native in origin. |

Table 1: Description of habitat zones in the study area

| Habitat Zone | EVC | Description |
|-----------------|---------------------------------------|--|
| H, I & J | Plains Grassy Woodland (EVC 55) | Spear Grass, Kangaroo Grass and Wallaby Grass were the dominant native species, providing a cover of 15–25%. Common Wheat-grass had a cover of 5% and there was a minimal cover of medium and small shrubs (Black Wattle) in HZ H and I. A 3% cover of herbs was recorded in HZ I. No canopy was present. Weed cover was approximately 30%, but reached up to 60% in HZ J. Dominant species were Toowoomba Canary-grass, Couch, Yorkshire Fog and Cocksfoot. Bryophytes and soil crusts were not present, nor were logs. Organic litter cover was 20- 30%. |
| K & L | Swamp Scrub (EVC 53) | No canopy cover was present, with the dominant life forms being tufted (15% cover) and non-tufted (10% cover) graminoids. Common species were Spear Grass, Common Blown-grass and Rush. A low herb cover was present (1%), being attributable to Small Loosestrife. Weed cover was 30%, mostly consisting of Rat-tail Grass, Rye Grass, Cocksfoot and Toowoomba Canary-grass. Bryophyte cover was 1%. Soil crusts and organic litter were not present. |
| М | Swamp Scrub (EVC 53) | Australian Sweet-grass was the dominant native species, having a total cover of 50%. No canopy trees were present. Weed cover was 5% and comprised Toowoomba Canary-grass, Cocksfoot and Cape Weed. No bryophytes or soil crusts were recorded. Organic litter cover was 5%. |
| N1 & N2 | Plains Grassy Woodland (EVC 55) | The dominant native species in these habitat zones were Spear Grass and Brown-back Wallaby-grass, with a cover of 30%. There was no canopy cover. Weed cover was 40%. High-threat weeds present were African Box-thorn, Brown-top Bent, African Thistle, Rat-tail Grass, Cocksfoot and Toowoomba Canary-grass. Bryophytes, soil crusts and logs were not present. Organic litter cover was 20% and was mostly native in origin. |
| O, P, Q & R | Plains Grassy Woodland (EVC 55) | These habitat zones lacked a canopy, with tufted graminoids and non- tufted graminoids the only life forms present. Spear Grass and Brown- back Wallaby-grass had a combined cover of 20–30%, while Rush and Common Wheat-grass had a cover of 1–10%. Weed cover was 60% and included high-threat Cocksfoot, Rat-tail Grass, African Box-thorn, Brown-top Bent and Toowoomba Canary-grass. Bryophytes, soil crusts and logs were absent. Organic litter cover was approximately 25% and native in origin. |

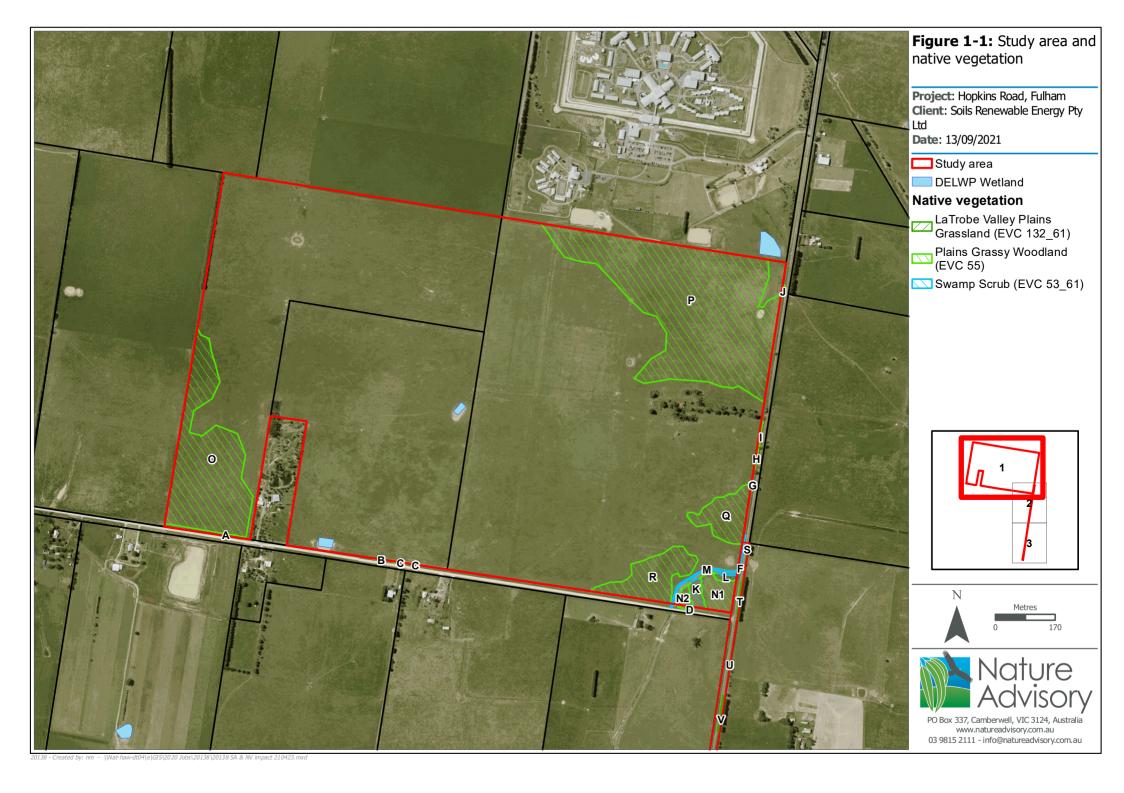

The habitat hectare assessment results for these habitat zones are provided in Table 2. More detailed habitat scoring results are presented in Appendix 2.

Table 2: Summary of habitat hectare assessment results

| Habitat Zone | EVC | Area (ha) | Condition score (out of 100) | No. of Large Trees in HZ |
|-----------------------------------|---------------------------------|-----------|---------------------------------|-----------------------------|
| A Plains Grassy Woodland (EVC 55) | | 0.025 | 25 | 0 |
| В | Plains Grassy Woodland (EVC 55) | 0.021 | 26 | 0 |
| С | Plains Grassy Woodland (EVC 55) | 0.024 | 25 | 0 |
| D | Plains Grassy Woodland (EVC 55) | 0.021 | 21 | 0 |
| E | Swamp Scrub (EVC 53) | 0.003 | 30 | 0 |
| F | Swamp Scrub (EVC 53) | 0.025 | 30 | 0 |
| G | Swamp Scrub (EVC 53) | 0.013 | 29 | 0 |
| н | Plains Grassy Woodland (EVC 55) | 0.014 | 27 | 0 |
| I | Plains Grassy Woodland (EVC 55) | 0.024 | 27 | 0 |
| J | Plains Grassy Woodland (EVC 55) | 0.004 | 24 | 0 |
| К | Swamp Scrub (EVC 53) | 0.280 | 28 | 0 |
| L | Swamp Scrub (EVC 53) | 0.102 28 | | 0 |
| М | Swamp Scrub (EVC 53) | 0.112 | 30 | 0 |
| N1 | Plains Grassy Woodland (EVC 55) | 0.824 | 28 | 0 |
| N2 | Plains Grassy Woodland (EVC 55) | 0.17 | 28 | 0 |
| 0 | Plains Grassy Woodland (EVC 55) | 7.476 | 27 | 0 |
| Р | Plains Grassy Woodland (EVC 55) | 16.316 | 27 | 0 |
| Q | Plains Grassy Woodland (EVC 55) | 1.62 | 25 | 0 |
| R | Plains Grassy Woodland (EVC 55) | 2.255 | 25 | 0 |
| | Total | 29.330 | | 0 |

5.2.2. Scattered trees

No scattered trees were recorded in the study area.

5.3. Flora species

5.3.1. Species recorded

During the field assessments, 35 plant species were recorded of which 16 (46%) were indigenous and 19 (54%) were introduced or non-indigenous native in origin (Appendix 3:).

5.3.2. Listed species

VBA records (DELWP 2021d) and the EPBC Protected Matters Search Tool (DAWE 2021a) indicated that within the search region there were records of, or potential suitable habitat occurred for 11 species listed under the Commonwealth EPBC Act and ten listed under the state FFG Act, including eight listed under both Acts. No flora species listed under the EPBC Act were recorded during the field survey.

The likelihood of occurrence of species listed under the EPBC Act and FFG Act in the study area is addressed in Table 3. Species considered 'likely to occur' are those that have a very high chance of occurring in the study area based on numerous records in the search region and the presence of suitable habitat in the study area. Species considered to have the 'potential to occur' are those for which suitable habitat exists but recent records are scarce.

This analysis indicates that no listed flora species are likely to occur or have the potential to occur in the study area due to the highly modified nature of the study area.

Table 3: Listed flora species and the likelihood of occurrence in the study area

| Common Name | Scientific name | EPBC | FFG | Habitat | Number of records |
|---------------------------|-----------------------------|------|-----|---|-------------------|
| River Swamp Wallaby-grass | Amphibromus fluitans | VU | | River Swamp Wallaby-grass mostly grows in permanent swamps and also lagoons, billabongs, dams and roadside ditches. The species requires moderately fertile soils with some bare ground; conditions that are caused by seasonally-fluctuating water levels (DAWE 2021). | None |
| Thick-lip Spider-orchid | Caladenia tessellata | VU | | Coastal Open Woodlands, Lowland Forest, Heathy Woodland (Entwisle 1994). | None |
| Dwarf Kerrawang | Commersonia prostrata | EN | L | In Victoria, the Dwarf Kerrawang grows on swampy, sometimes ephemeral wetlands and lake margins, often dominated by <i>Lepidosperma</i> spp. (Short 1996; James 2003; Carter & Walsh 2010a). Dwarf Kerrawang is part of the Gippsland Red Gum (<i>Eucalyptus tereticornis</i> subsp. <i>mediana</i>) Grassy Woodland and associated native grassland ecological community, listed under the EPBC Act as critically endangered. The species also occurs in habitat of the Victorian listed communities Coastal Manna Gum (<i>Eucalyptus</i> <i>viminalis</i> subsp. <i>pryoriana</i>) Woodland and Lowland Forest dominated by White Stringybark (<i>Eucalyptus globoidea</i>) (James 2003). | None |
| Small Scurf-pea | Cullen parvum | | L | The species grows in grasslands and grassy (River Red-gum) woodlands in areas with rainfall of between 450 and 700 mm (Jeanes, 1996). These sites are subject to irregular flooding and have relatively rich soils derived from alluvium. An exception is the population near Shelford that grows on rocky clay soils derived from basalt (DSE 2005). | 2 |
| Matted Flax-lily | Dianella amoena | EN | L | Lowland grassland and grassy woodlands on well-drained to seasonally waterlogged fertile sandy loams to heavy cracking soils derived from sedimentary or volcanic Geology. Widely distributed from eastern to south- western Victoria (DAWE 2021). | None |
| Purple Diuris | Diuris punctata | | L | Principally in lowland native grasslands, grassy woodlands, heathy woodlands and open heathlands, usually on fertile, loamy soils and including periodically inundated areas (Earl & Barlow 2004). | 12 |
| Clover Glycine | Glycine latrobeana | VU | L | Found across south-eastern Australia in native grasslands, dry sclerophyll forests, woodlands and low open woodlands with a grassy ground layer. In Victoria, populations occur in lowland grasslands, grassy woodlands and sometimes in grassy heath (DAWE 2021). | None |
| Basalt Peppercress | Lepidium hyssopifolium s.s. | EN | L | Known to establish on open, bare ground with limited competition from other plants. Previously recorded from Eucalypt woodland with a grassy ground cover and low open Casuarina woodland with a grassy ground cover and tussock grassland. Now generally found amongst exotic pasture grasses and beneath exotic trees (DAWE 2021). | None |

| Date of last record | Likelihood of occurrence |
|------------------------|---|
| N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| 1/01/2005 | Study area was highly modified - Unlikely to occur. |
| N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| 7/10/2019 | Study area was highly modified - Unlikely to occur. |

Hopkins Road, Fulham – Flora and Fauna Assessment

| Common Name | Scientific name | EPBC | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|-------------------------|---------------------------|------|-----|---|-------------------|------------------------|---|
| Maroon Leek-orchid | Prasophyllum frenchii | EN | L | Grows mainly in open sedge swampland or in wet grassland and wet heathland generally bordering swampy regions. Sites are generally low altitude, flat and moist. Soils are generally moderately rich damp sandy or black clay loams. Climate is mild, with an annual rainfall of 600–1100 mm, occurring predominantly in winter and spring (DAWE 2021). | None | N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| Wellington Mint-bush | Prostanthera galbraithiae | VU | L | Heathy open forest, usually on gravelly sand (Conn 1999). | 61 | 14/09/2018 | Study area was highly modified - Unlikely to occur. |
| Green-striped Greenhood | Pterostylis chlorogramma | VU | L | Occurs in mixed Box-Stringybark forest with a shrubby understorey, often with <i>Pteridium esculentum</i> as a major component on sandy or clay loam soils (Duncan <i>et al.</i> 2009). | None | N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| Swamp Fireweed | Senecio psilocarpus | VU | | Herb-rich winter-wet swamps on volcanic clays or peaty soils (Walsh 1999). Known from approximately 10 sites between Wallan, about 45 km north of Melbourne and Honans Scrub in south-eastern South Australia (TSSC 2008). | None | N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |
| Swamp Everlasting | Xerochrysum palustre | VU | L | Grows in wetlands including sedge-swamps and shallow freshwater marshes, often on heavy black clay soils. Commonly associated genera include Amphibromus, Baumea, Carex, Chorizandra, Craspedia, Eleocharis, Isolepis, Lachnagrostis, Lepidosperma, Myriophyllum, Phragmites australis, Themeda triandra and Villarsia (DAWE 2021). | None | N/A | Study area was highly modified and there are no recent nearby records - Unlikely to occur. |

Notes: EPBC = threatened species status under EPBC Act (EX = presumed extinct in the wild; CR = critically endangered; EN = endangered; VU = vulnerable); FFG = threatened species status under the FFG Act = listed as threatened (L) under the FFG Act.

5.4. Fauna habitats

The study area supported the following fauna habitat types.

- Grassland habitat;
- Wetland habitat; and
- Planted vegetation.

Grassland habitat: Approximately 15% of the study area comprised native grassland that supported Spear Grass, Wallaby Grass and Common Wheat-grass. Almost the entire remainder of the study area supported non-native grassland dominated by Rye Grass, Cocksfoot, Yorkshire Fog and Toowoomba Canary-grass. These grasslands had a history of grazing by cattle. The grassland habitat continued into adjacent properties forming a larger core area. Such habitat is shown in Photo 1.

Photo 1: Grassland habitat

Wetland habitat: A very small portion of the study area (approximately 0.2%) supported wetland habitat that included farm dams and a narrow drainage line. This habitat was degraded and supported sparse fringing vegetation due to stock access and erosion. These areas were mostly isolated but may attract frogs and some waterbirds, and provide a drinking spot for birds and other vertebrates. Such habitat is shown in Photo 2.

Photo 2: Wetland habitat

Planted vegetation: A small area of planted vegetation occurred at the eastern extent of the study area. This included Pine trees and Sugar Gums, and a dense understorey of the high-threat weed African Box-

thorn. This habitat may provide roosting and nesting sites for birds and arboreal mammals, while the understorey may provide cover for ground-dwelling fauna. This habitat is isolated from other wooded habitat in the surrounding landscape. Such habitat is shown in Photo 3.

Photo 3: Planted vegetation

5.5. Fauna species

5.5.1. Listed species

The review of existing information [including VBA records (DELWP 2021d) and results of the EPBC Protected Matters Search Tool (DAWE 2021a)] indicated that within the search region there were records of, or there was potential suitable habitat for, 34 fauna species listed under the Commonwealth EPBC Act and the state FFG Act. The likelihood of occurrence of these species in the study area was assessed and the results are presented in Table 4.

This analysis of potential occurrence of listed fauna species excludes:

- Marine fauna given that the study area is inland; and
- Migratory oceanic bird species (such as albatrosses and petrels), and migratory shorebirds given that the study area is inland.

Species considered 'likely to occur' are those that have a very high chance of being in the study area given the existence of numerous records in the search region and suitable habitat in the study area. Using the precautionary approach, species considered to have the 'potential to occur' are those for which suitable habitat exists, but recent records are scarce. This analysis indicates that seven listed fauna species are likely to occur or have the potential to occur. These species include the following:

- Black Falcon (listed under FFG Act);
- Fork-tailed Swift (Migratory under EPBC Act);
- Great Egret (listed under FFG Act);
- Latham's Snipe (Migratory under EPBC Act);
- Magpie Goose (listed under FFG Act);
- White-throated Needletail (Migratory under EPBC Act);
- Green and Golden Bell Frog (Vulnerable under EPBC Act).

The susceptibility of these species to impacts from development is discussed in Section 5.5.2.

Table 4: Listed fauna species and the likelihood of occurrence in the study area

| Common Name | Scientific name | EPBC-T | EPBC-M | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|------------------------------|---------------------------|--------|---------------------------------|-----|---|-------------------|---------------------|--|
| | | | | | Birds | | | |
| Australasian Bittern | Botaurus poiciloptilus | EN | | L | Terrestrial wetlands, including a range of wetland types but prefers permanent water bodies with tall dense vegetation, particularly those dominated by sedges, rush, reeds or cutting grass (Marchant & Higgins 1990). | 1 | 4/04/2019 | Habitat in study area is highly modified - Unlikely to occur. |
| Australian Painted- snipe | Rostratula australis | EN | | L | L Generally inhabits shallow terrestrial freshwater wetlands, including temporary and permanent lakes, swamps and claypans. This species also uses inundated or waterlogged grassland or saltmarsh, dams, rice crops, sewage farms and bore drains. Typical sites include those with rank emergent tussocks of grass, sedges, rushes or reeds, or samphire; often with scattered clumps of Lignum or Canegrass or sometimes Teatree. Sometimes utilises areas that are lined with trees or that have some scattered fallen or washed-up timber (DAWE 2020). | | N/A | Suitable habitat in study area, however no records in the region and species very scarce in the SE of Australia - Unlikely to occur. |
| Black Falcon | Falco subniger | | | L | Woodlands, open country and terrestrial wetlands; in arid and semi-arid zones; mainly over open plains and undulating land with large tracts of low vegetation. More commonly found in north-western Victoria and only occasionally found in southern Victoria. A highly mobile species, moving in response to food availability and seasonal conditions (Marchant & Higgins 1993). | 1 | 18/05/2020 | Suitable open habitat in study area and recent records in the vicinity - Potential to occur. |
| Black-faced Monarch | Monarcha melanopsis | | M (Bonn A2H) | | Rainforests, eucalypt woodlands, coastal scrub and damp gullies (Higgins <i>et al</i> . 2006). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Diamond Firetail | Stagonopleura guttata | | | L | Commonly found in box-ironbark forests and woodlands and also occurs along watercourses and in farmland areas. Widespread but scattered. Forages on a wide range of seeds, which in some cases a large portion can be derived from weed species (Read 1994). Populations had declined in Victoria since the 1950s (Emison <i>et al.</i> 1987; Tzaros 2005). | 2 | 30/12/1998 | Habitat in study area is highly modified. Nearest suitable habitat at the foothills of the ranges - Potential to occur. |
| Fork-tailed Swift | Apus pacificus | | M (CAMBA, ROKAMBA, JAMBA) | | The species can occur in wet sclerophyll forest but mainly prefers open forest or plains. Almost exclusively aerial and feeds up to hundreds of metres above the ground, but can feed among open forest canopy. The species breeds internationally and seldom roosts in trees (Higgins 1999). | None | N/A | Highly mobile aerial species, occurs in the region annually - Potential to occur. |
| Freckled Duck | Stictonetta naevosa | | | L | Terrestrial wetlands; prefers fresh, densely vegetated waters, particularly floodwater swamps and creeks vegetated with Lignum or Cane Grass. During dry seasons or droughts, moves off ephemeral breeding swamps and occupies large permanent waters (Marchant & Higgins 1990). | 117 | 13/06/2019 | Habitat in study area is highly modified - Unlikely to occur. |
| Glossy Ibis | Plegadis falcinellus | | M (Bonn A2S) | | Prefers freshwater inland wetlands, in particular, permanent or ephemeral water bodies and swamps with abundant vegetation (Marchant & Higgins 1990). | 8 | 18/05/2020 | Habitat in study area is highly modified - Unlikely to occur. |
| Great Egret | Ardea alba | | | L | Occurs in a variety of wetlands including: permanent water bodies on flood plains; shallows of deep permanent lakes, either open or vegetated with shrubs or trees; semi-permanent swamps with tall emergent vegetation (e.g. Bulrush) and herb dominated seasonal swamps with abundant aquatic flora (Marchant & Higgins 1990). | 61 | 6/05/2019 | Suitable habitat in study area and recent records in the vicinity - Potential to occur. |

| Common Name | Scientific name | EPBC-T | EPBC-M | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|-----------------------|------------------------------|--------|---|-----|--|-------------------|---------------------|---|
| Grey Falcon | Falco hypoleucos | VU | | L | Inhabits arid and semi-arid zones; mainly on sandy and stony plains of inland drainage systems, lightly timbered with acacia. Hunts far into open areas, over spinifex, tussock grasslands and low shrublands. In Victoria, few records mostly in north and north-western regions (Marchant & Higgins 1993). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Grey Goshawk | Accipiter novaehollandiae | | | L | Inhabits rainforests, open forests, swamp forests, woodlands and plantations; most abundant where forest or woodland provide cover for hunting from perches. In Victoria, most common in Otway ranges (Marchant & Higgins 1993). | 2 | 18/05/2020 | No suitable habitat in study area - Unlikely to occur. |
| Latham's Snipe | Gallinago hardwickii | | M (Bonn A2H, ROKAMBA, JAMBA, CAMBA) | | Occurs in wide variety of permanent and ephemeral wetlands; prefers open freshwater wetlands with dense cover nearby, such as the edges of rivers and creeks, bogs, swamps and waterholes. The species is widespread in south-eastern Australia and most of its population occurs in Victoria, except in the northwest of the state (Naarding 1983; Higgins & Davies 1996). | 84 | 2/02/2019 | Suitable habitat in study area and several recent nearby records - Likely to occur. |
| Little Egret | Egretta garzetta | | | L | Occurs in a range of coastal and terrestrial wetlands, including freshwater wetlands with vegetation such as Bulrush and requires trees for roosting and nesting (Marchant & Higgins 1990). | 8 | 10/11/2018 | Habitat in study area is highly modified - Unlikely to occur. |
| Magpie Goose | Anseranas semipalmata | | | L | Terrestrial and aquatic habitats, but activities cantered on wetlands, mainly those on floodplains of rivers (Marchant & Higgins 1990). | 6 | 31/03/2007 | Suitable habitat in study area, records in the vicinity in similar habitat - Potential to occur. |
| Masked Owl | Tyto novaehollandiae | | | L | Open woodlands and forests that provide dense, tall tree cover, and adjoining open habitats such as cleared farmlands. In Victoria, most widespread in E. Gippsland (Higgins 1999). | 1 | 30/03/2006 | No suitable habitat in study area - Unlikely to occur. |
| Osprey | Pandion cristatus | | M (Bonn A2S) | | Rare vagrant to Victoria (Marchant & Higgins 1993). Littoral and coastal habitats and terrestrial wetlands. Mostly found in coastal areas but occasionally travel inland along major rivers (Marchant & Higgins 1993; Olsen 1995; Johnstone & Storr 1998). Require extensive areas of open fresh, brackish or saline water for foraging (Marchant & Higgins 1993). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Painted Honeyeater | Grantiella picta | VU | | L | Inhabits box-ironbark forests and woodlands and mainly feeds on the fruits of mistletoe. Strongly associated with mistletoe around the margins of open forests and woodlands. Can also be found in farmland containing remnant treed vegetation. Occurs at few localities. Uncommon breeding migrant from further north, arriving in October and leaving in February (Higgins <i>et al.</i> 2001; Tzaros 2005). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Plumed Egret | Ardea plumifera | | | L | Mainly inhabits terrestrial wetlands; only occasionally visits coastal wetlands and forages amongst aquatic vegetation in shallow water and requires trees for roosting and nesting. Often occurs in wetlands that contain vegetation, including Bulrush (Marchant & Higgins 1990). | 5 | 18/05/2020 | Habitat in study area is highly modified - Unlikely to occur. |

| Common Name | Scientific name | EPBC-T | EPBC-M | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|------------------------------|---------------------------|--------|---------------------------------|-----|--|-------------------|---------------------|--|
| Powerful Owl | Ninox strenua | | | L | Found in tall, open wet sclerophyll forests with sheltered gullies and old growth forest with dense understorey. Also found in dry forests with box and ironbark eucalypts and River Red-gum. Large old trees with hollows are required by this species for nesting. In Victoria, Powerful Owl is widespread, having been recorded from most of the state. However, throughout its range it is uncommon and occurs in low densities (Higgins 1999). Also occurs in highly urbanised areas, such as metropolitan Melbourne, heavily reliant upon various forms of movement corridors (riparian strips, roadside vegetation and recreational reserves) to both hunt within and navigate throughout the landscape (Carter <i>et al.</i> 2019). | 2 | 30/03/2006 | No suitable habitat in study area - Unlikely to occur. |
| Regent Honeyeater | Anthochaera phrygia | CR | | L | Inhabits dry box-ironbark eucalypt forests near rivers and creeks on inland slopes of the Great Dividing Range. Can also occur in small remnant patches or in mature trees in farmland or partly cleared agricultural land (Higgins <i>et al.</i> 2001). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Rufous Fantail | Rhipidura rufifrons | | M (Bonn A2H) | | In east and south-east Australia, mainly inhabits tall wet sclerophyll forests, often in gullies. When on passage in warmer months, sometimes recorded in drier sclerophyll forests and woodlands, and parks and gardens (Higgins <i>et al.</i> 2006). Virtually absent from south- eastern Australia during winter (Higgins <i>et al.</i> 2006). | 1 | 4/02/2019 | No suitable habitat in study area - Unlikely to occur. |
| Satin Flycatcher | Myiagra cyanoleuca | | M (Bonn A2H) | | Mostly found in eucalypt forest, particularly tall wet forests and woodland within gullies (Higgins <i>et al.</i> 2006). Also inhabits eucalypt woodland comprising an open understorey and a grassy ground layer (Higgins <i>et al.</i> 2006). Generally absent from rainforest (Higgins <i>et al.</i> 2006). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Swift Parrot | Lathamus discolor | CR | | L | Prefers a select range of eucalypts in Victoria, including Yellow Gum, Grey Box, White Box, Red Ironbark and Yellow Box, and River Red-gum when this species supports abundant 'lerp' (Saunders & Tzaros 2011). The species is also known to forage within planted stands of Spotted Gum and Sugar Gum (Nature Advisory; unpublished data). Breeds in Tasmania and migrates to the mainland of Australia for the autumn, winter and early spring months. It lives mostly north of the Great Dividing Range, passing through two areas of Victoria on migration: the Port Phillip district and Gippsland (Emison <i>et al.</i> 1987; Higgins 1999; Kennedy & Tzaros 2005), though it is also not uncommonly sighted in urban areas (Nature Advisory; unpublished data). Occurrence of this species on the mainland can substantially change from year to year depending on food availability, giving potential for this species to occur almost anywhere throughout its range (Emison <i>et al.</i> 1987). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| White-bellied Sea- Eagle | Haliaeetus Ieucogaster | | | L | Maritime habitats, large terrestrial wetlands and coastal lands of tropical and temperate Australia and offshore islands, ranging far inland only over large rivers and wetlands. The eagles usually breed on coast and offshore islands and inland beside large lakes or rivers, usually in tall trees in or near water, also in cliffs, rock pinnacles and escarpments (Marchant & Higgins 1993). | 37 | 23/05/2019 | No suitable habitat in study area - Unlikely to occur. |
| White-throated Needletail | Hirundapus caudacutus | VU | M (CAMBA, ROKAMBA, JAMBA) | | Aerial, over all habitats, but probably more over wooded areas, including open forest and rainforest. Often over heathland and less often above treeless areas such as grassland and swamps or farmland (Higgins 1999). | 8 | 21/01/2010 | Highly mobile aerial species with recent nearby records - Potential to occur. |

| Common Name | Scientific name | EPBC-T | EPBC-M | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|----------------------------------|---------------------------------|--------|---------------------------------|-----|---|-------------------|---------------------|--|
| Yellow Wagtail | Motacilla flava | | M (CAMBA, JAMBA, ROKAMBA) | | Regular non-breeding visitor in northern Australia mainly spring-summer, vagrant to the south. Occupies a wide range of habitats, usually open areas with low vegetation such as crop, grassland and even parkland. Often recorded near water (Higgins, Peter & Cowling 1999) | None | N/A | Species scarce in the south of Australia and no recent nearby records - Unlikely to occur. |
| | | | | | Mammals | | | |
| Southern Greater Glider | Petauroides volans | VU | | L | In Victoria, this species inhabits forest habitats dominated by peppermint, stringybark, ash and gum eucalypts (Menkhorst 1995). Restricted to the central highlands and eastern Victoria, and common in areas of high rainfall. Rare in dry stringybark-box and Snow Gum forest, and does not occur in the box-ironbark or River Red-gum dominated riverina regions (Menkhorst 1995). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Spot-tailed Quoll | Dasyurus maculatus maculatus | EN | | L | Rainforest, wet and dry forest, coastal heath and scrub and River Red- gum woodlands along inland rivers (Menkhorst 1995). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| White-footed Dunnart | Sminthopsis leucopus | | | L | Coastal tussock grassland and sedgeland, wet heath, and forest or woodland with a dense heathy understorey or mid-storey vegetation (Menkhorst 1995). | 1 | 22/09/2017 | No suitable habitat in study area - Unlikely to occur. |
| | | | | | Bats | | | |
| Yellow-bellied Sheathtail Bat | Saccolaimus flaviventris | | | L | Known to occur from urban, agricultural semi-arid and tall wet forest habitats (Menkhorst 1995). | 1 | 11/04/1990 | Suitable habitat in study area. Species very scarce in southern Victoria - Unlikely to occur. |
| | | | | | Amphibians | | | |
| Giant Burrowing Frog | Heleioporus australiacus | VU | | L | Across its range, the Giant Burrowing Frog appears to be dependent on areas with native vegetation, as no Giant Burrowing Frogs have been recorded from cleared lands. However, it should be noted that no targeted surveys for the species have occurred in such lands. A BIOCLIM analysis suggests that the species is not climatically suited to large river valleys, most of which have now been cleared for agriculture. In the southern portion of its range, the Giant Burrowing Frog has been reported to occur in a wide range of forest communities including montane sclerophyll woodland, montane riparian woodland, and wet and dry sclerophyll forest (DAWE 2020). | None | N/A | No suitable habitat in study area and no recent nearby records - Unlikely to occur. |
| Green and Golden Bell Frog | Litoria aurea | VU | | | Permanent water with fringing or emergent vegetation in streams, swamps, lagoons, farm dams and ornamental ponds (Cogger 2000). Also occurs in disturbed sites such as disused industrial sites, brick pits, mines and council tips (Tyler 1997). | 2 | 18/05/2020 | Suitable habitat in study area and recent records nearby - Potential to occur. |
| | | | | | Fish | | | |
| Australian Grayling | Prototroctes maraena | VU | | L | Large and small coastal streams and rivers with cool, clear waters with a gravel substrate and altering pools and riffles (Cadwallader & Backhouse 1983). | 1 | 3/02/2016 | No suitable habitat in study area - Unlikely to occur. |

| Common Name | Scientific name | EPBC-T | EPBC-M | FFG | Habitat | Number of records | Date of last record | Likelihood of occurrence |
|----------------|--------------------|--------|--------|-----|---|-------------------|---------------------|---|
| Dwarf Galaxias | Galaxiella pusilla | VU | | L | Ranges from the far west of the state through to the Mitchell River basin in central Gippsland. Vegetated margins of still water, ditches, swamps and backwaters of creeks, both ephemeral and permanent (Allen <i>et al.</i> 2002). Some wetlands where it occurs may partially or completely dry up during summer, with such wetlands reliant on seasonal flooding plus linkages to other sites where the species occurs, for habitat and population replenishment (Saddlier, Jackson & Hammer 2010). Also often found in association with burrowing freshwater crayfish (Engaeus spp.), with the crayfish burrows reportedly providing refuge from predators and dry conditions for the species (Saddlier, Jackson & Hammer 2010). | 4 | 28/03/2012 | Habitat in study area is highly modified - Unlikely to occur. |

Notes: EPBC-T = threatened species status under EPBC Act (EX = presumed extinct in the wild; CR = critically endangered; EN = endangered; VU = vulnerable); EPBC-M: migratory status under the EPBC Act (M = listed migratory taxa; Bonn Convention (A2H) – Convention on the Conservation of Migratory Species of Wild Animals – listed as a member of a family; Bonn Convention (A2S) – Convention on the Conservation of Migratory Species of Wild Animals – listed as a member of a family; CAMBA – China-Australia Migratory Birds Agreement; JAMBA – Japan-Australia Migratory Birds Agreement; ROKAMBA – Republic of Korea Australia Migratory Birds Agreement); FFG = listed as threatened (L) under the FFG Act.

5.5.2. Susceptibility of listed fauna to impacts

The following analysis identifies the susceptibility to development of listed fauna species that may utilise the study area. This analysis includes consideration of the factors below.

• The mobility of the species; and

The availability and extent of other suitable habitat in the region and the degree to which each species may rely on habitat in the study area.

Targeted surveys will be required to determine the presence or absence of any listed fauna species considered to be susceptible to impacts from development.

Birds (non-migratory)

Three listed non-migratory bird species are considered to have the potential to occur in the study area. The susceptibility of these species to possible impacts from any development in the study area is discussed below.

Black Falcon (listed under FFG Act)

This species mainly preys on small and medium-sized birds and the study area provides habitat for open farmland birds that constitute part of the diet. The species is uncommon in the region however and is therefore unlikely to be impacted by the development.

Great Egret (listed under FFG Act)

Habitat on site for this species is considered to be suboptimal due to the lack of fringing vegetation around the farm dams and the size of the dams. However, due to the proximity of larger water bodies and wetlands the species may possibly occur incidentally in the study site. Due to the lack of quality habitat on site, Great Egret is unlikely to be impacted by the development.

Magpie Goose (listed under FFG Act)

This species is scarce in Victoria and can use a variety of wetland habitats provided there are large wetlands with paddocks in the vicinity. Given the habitat on site is of moderate suitability, and high-quality habitat is found in the vicinity, the species may occur incidentally, however development of the site is unlikely to impact Magpie Goose.

Migratory Birds

Three listed migratory bird species (excluding oceanic species and shorebirds) have the potential to occur in the study area. The susceptibility of these species to possible impacts from any development in the study area is discussed below.

White-throated Needletail (Vulnerable under EPBC Act)

This species may occur in the study area, however only in the capacity of flying over due to the strictly aerial biology. White-throated Needletail depends mostly on extensive forests to forage but may occasionally use adjacent farmland. Due to the lack of forested areas in the vicinity this species is unlikely to be impacted by the development.

Fork-tailed Swift (Migratory under EPBC Act)

This species may occur in the study area, however only in the capacity of flying over due to the strictly aerial biology. Differently to White-throated Needletail, this species prefers open landscapes to forests. However, due to the abundance of this habitat in the region and the scarce records of the species in the vicinity, this species is unlikely to be impacted by the development.

Latham's Snipe (Migratory under EPBC Act)

The site holds suitable habitat for the species in the form of dams, drainage lines and flooded pasture. The species will likely occur occasionally in the study area, however due to the wide availability of higher quality habitat in the reserves to the south and east Latham's Snipe is unlikely to be impacted by the development.

Frogs

One listed frog species is considered to have the potential to occur in the study area. The susceptibility of this species to possible impacts from any development in the study area is discussed below.

Green and Golden Bell Frog (Vulnerable under EPBC Act)

Habitat on site is of moderate suitability, however due to the presence of the species in nearby wetlands this could occur incidentally during rainy periods when some individuals disperse in search of new breeding areas. Due to the low quality of the habitat on site and the availability of optimal habitat in the broader region, the Green and Golden Bell Frog is unlikely to be impacted by the development.

5.6. Listed ecological communities

The EPBC Protected Matters Search Tool (DAWE 2021a) indicated that three ecological communities listed under the EPBC Act had the potential to occur in the search region (Table 5). The occurrence in the study area was determined based on an assessment of the native vegetation present against published descriptions and condition thresholds for these communities.

Table 5: EPBC Act-listed ecological communities and likelihood of occurrence in the study area

| Ecological Community | EPBC Status | Occurrence in the study area |
|--|----------------|---|
| Gippsland Red Gum (<i>Eucalyptus tereticornis</i> subsp. mediana) Grassy Woodland and Associated Native Grassland | CR | The study area was highly modified and does not support any native treed vegetation – Does not occur. |
| Natural Damp Grassland of the Victorian Coastal Plains | CR | The study area was highly modified and is derived from Plains Grassy Woodland (EVC 55) that is contra-indicative of the community – Does not occur. |
| Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains | CR | The study area was highly modified and any areas with the potential to host the community were less than 0.5 hectares – Does not occur. |

Notes: EPBC = status under the EPBC Act (CR = Critically Endangered).

6. Assessment of impacts

6.1. Proposed development

The current proposal will involve the installation of a solar farm facility.

To determine impacts to native vegetation, the proposed development plan was overlaid with the native vegetation mapped as part of this investigation. Native vegetation occurring in the following locations was considered to be removed based on the proposed plan:

- Direct removal:
 - Native vegetation within all proposed development areas
 - Native vegetation within proposed driveway

6.2. Impacts of proposed development

6.2.1. Native vegetation

The current proposal will result in the loss of a total extent of 27.878 hectares of native vegetation as represented in Figure 2 and documented in the *Native Vegetation Removal* (NVR) report provided by DELWP (Appendix 6:).

This comprised the following:

- 27.714 hectares of native vegetation in patches (including no large trees in patches); and
- 0.164 hectares of DELWP mapped wetlands.

No native vegetation has been approved for removal on the property within the last five years.

Photographs of native vegetation proposed for removal are provided in Appendix 4.

6.2.2. Modelled species important habitat

The current proposal footprint will not have a significant impact on any habitat for any rare or threatened species as determined in Appendix 6:

6.2.3. Listed flora species

The analysis of the likelihood of occurrence of listed flora species presented in Section 5.3.2 identified that no listed flora species would be impacted by any development in the study area.

6.2.4. Fauna habitat

The proposed development will result in the removal of at least 150 hectares of fauna habitat, predominantly in the form of grassland and pasture.

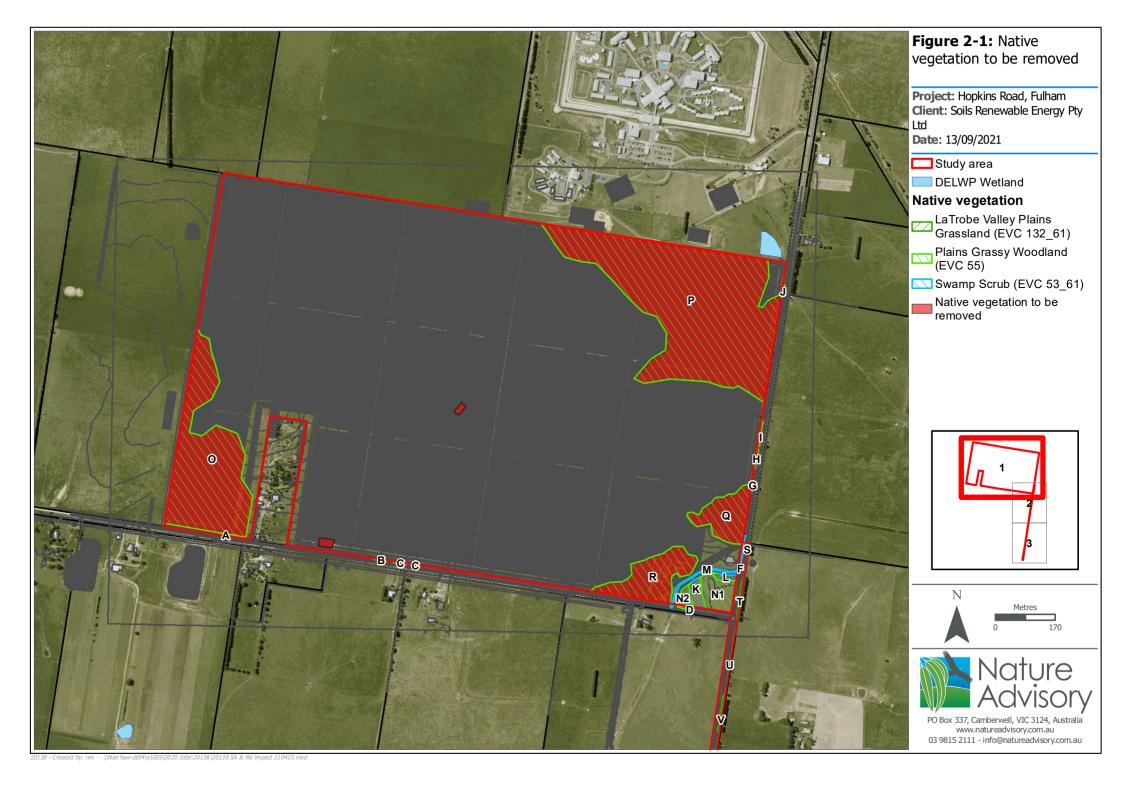

6.2.5. Listed fauna species

The analysis of susceptibility of listed fauna species to impacts presented in Section 5.5.2 identified that no listed fauna species could be impacted by development of the study area.

6.2.6. Threatened ecological communities

The proposed development footprint will not result in the loss of any threatened ecological communities.

7. Implications under legislation and policy

7.1. Summary of planning implications

No overlays cover the study area.

A planning permit under Clause 52.17 of the Wellington Planning Scheme is required for the removal of native vegetation.

7.2. Implications under the Guidelines

7.2.1. Avoid and minimise statement

In accordance with the Guidelines, all applications to remove native vegetation must provide an avoid and minimise statement that describes any efforts undertaken to avoid the removal of, and minimise the impacts on biodiversity and other values of native vegetation, and how these efforts focus on areas of native vegetation that have the most value. Efforts to avoid and minimise impacts to native vegetation in the current application are presented as follows:

- Strategic level planning the solar energy facility is proposed for an area that has been historically cleared and is highly modified from the original state. As such, this supports low quality vegetation compared to some surrounding areas.
- Site level planning development will avoid native vegetation present on the roadsides. The highest quality vegetation, that is the vegetation in the south-eastern corner of the study area, will also be avoided. The site's primary and secondary access points have been designed to ensure retention of native vegetation. The solar panels will also sit atop the grassland, as such the majority of the grassland will remain. It should also be noted that the solar farm has an expected operation life of approximately 35 years. A decommissioning plan requires the land to be converted back to its original state after the use has ceased. Additionally, the project will provide the appropriate offset to compensate for the biodiversity impact from the removal of the native vegetation.
- Furthermore, the proponent advises that no feasible opportunities exist to further avoid and minimise impacts on native vegetation without undermining the key objectives of the proposal. More specifically, the solar panels are installed in rows of 'solar tables', of which the length is 105 m. Accordingly, to retain a 1 m x 1 m patch, the site would lose approximately 87 solar panels. For the solar farm project to be feasible for all stakeholders it must generate approximately 80 MW of electricity, the loss of solar panels to retain further patches of poor quality native vegetation could jeopardise the project.

7.2.2. Assessment pathway

The assessment pathway is determined by the location category and extent of native vegetation as detailed for the study area as follows:

- Location Category: Location 2
- Extent of native vegetation: A total of 27.879 hectares of native vegetation (including no large trees).

Based on these details, the Guidelines stipulate that the proposal is to be assessed under the Detailed assessment pathway.

This proposal would trigger a referral to DELWP based on the criteria specified in Section 3.3.3.

7.2.3. Offset requirements

Offsets required to compensate for the proposed removal of native vegetation from the study area are provided below.

- 8.180 general habitat units and must include the following offset attribute requirements:
 - Minimum strategic biodiversity value (SBV) of 0.373; and
 - Occur within the West Gippsland CMA boundary or the Wellington municipal district.

7.2.4. Offset statement

The offset target for the current proposal will be achieved via a third-party offset.

An online search of the Native Vegetation Credit Register (NVCR) has shown that the required offset is currently available for purchase from a native vegetation credit owner (DELWP 2021e).

Evidence that the required offset is available is provided in Appendix 7: . The required offset would be secured following approval of the application to remove native vegetation.

7.3. EPBC Act

The EPBC Act protects a number of threatened species and ecological communities that are considered to be of national conservation significance. Any significant impacts on these species require the approval of the Australian Minister for the Environment.

Based on the relevant guidelines, the proposed development is unlikely to result in a significant impact on any EPBC Act-listed values. For this reason, Referral of the project under the Act is not necessary.

7.4. FFG Act

The Victorian FFG Act lists threatened and protected species and ecological communities (DELWP 2017b, 2018b). Any removal of threatened flora species or communities (or protected flora) listed under the FFG Act from public land requires a Protected Flora Permit under the Act, obtained from DELWP.

The following FFG Act values listed as threatened or protected were recorded on public land:

Black Wattle (protected)

However, this value is not susceptible to impacts from the proposed development on public land, and a Protected Flora Licence or Permit under the FFG Act would not be required for the current proposal.

7.5. EE Act

The *Ministerial Guidelines for Assessment of Environmental Effects under the* Environment Effects Act 1978 (DSE 2006) identifies criteria that trigger a Referral to the State Minister for Planning.

Based on the relevant criteria, a Referral to the State Minister for Planning will be required under the EE Act due to the extent of removal being greater than ten hectares and this being the endangered EVC Plains Grassy Woodland (EVC 55).

7.6. CaLP Act

The *Catchment and Land Protection Act* 1994 (CaLP Act) requires that landowners (or a third party to whom responsibilities have been legally transferred) must eradicate regionally prohibited weeds and prevent the growth and spread of regionally controlled weeds.

Property owners who do not eradicate regionally prohibited weeds or prevent the growth and spread of regionally controlled weeds for which they are responsible, may be issued with a Land Management Notice or Directions Notice that requires specific control work to be undertaken.

In accordance with the *Catchment and Land Protection Act* 1994, the noxious weed species listed below that were recorded in the study area, must be controlled.

African Box-thorn

Precision control methods that minimise off-target kills (e.g. spot spraying) should be used in environmentally sensitive areas (e.g. within or near native vegetation, waterways, etc.).

7.7. Construction mitigation recommendations

Recommendations to mitigate impacts to vegetation during construction are provided below:

- Establish appropriate vegetation protection zones around areas of native vegetation to be retained prior to works.
- Ensure all construction personnel are appropriately briefed prior to works, and that no construction personnel, machinery or equipment are placed inside vegetation protection zones.

Appendix 1: Details of the assessment process in accordance with the Guidelines for the removal, destruction or lopping of native vegetation (DELWP 2017a)

Purpose and objective

Policies and strategies relating to the protection and management of native vegetation in Victoria are defined in the State Planning Policy Framework (SPPF). The objective identified in Clause 12.01 of all Victorian Planning Schemes is 'To ensure that there is no net loss to biodiversity as a result of the removal, destruction or lopping of native vegetation'.

This is to be achieved through the following three-step approach, as detailed in the Guidelines:

- 1. Avoid the removal, destruction or lopping of native vegetation.
- 2. Minimise impacts from the removal, destruction or lopping of native vegetation that cannot be avoided.
- 3. Provide an offset to compensate for the biodiversity impact from the removal, destruction or lopping of native vegetation.

Note: While a planning permit may still be required, if native vegetation does not meet the definition of either a patch or a scattered tree, an offset under the Guidelines is not required.

Assessment pathways

The first step in determining the type of assessment required for any site in Victoria is to determine the assessment pathway for the proposed native vegetation removal. The three possible assessment pathways for applications to remove native vegetation in Victoria are:

- Basic;
- Intermediate; or
- Detailed.

This assessment pathway is determined by two factors:

- Location Category, as determined using the states' Location Map. The location category indicates the
 potential risk to biodiversity from removing a small amount of native vegetation. The three location
 categories are defined as:
 - Location 1 shown in light blue-green on the Location Map; occurring over most of Victoria.
 - Location 2 shown in dark blue-green on the Location Map; includes areas mapped as endangered EVCs and/or sensitive wetlands and coastal areas.
 - Location 3 shown in brown on the Location Map; includes areas where the removal of less than 0.5 hectares of native vegetation could have a significant impact on habitat for rare and threatened species.
- Extent of native vegetation The extent of any patches and scattered trees proposed to be removed (and the extent of any past native vegetation removal), with consideration as to whether the proposed removal includes any large trees. Extent of native vegetation is determined as follows:
 - **Patch** the area of the patch in hectares.
 - Scattered Tree the extent of a scattered tree is dependent on whether the scattered tree is small or large. A tree is considered to be a large tree if it is greater or equal to the large tree benchmark diameter at breast height (DBH) for the relevant bioregional EVC. Any scattered

tree that is not a large tree is a small scattered tree. The extent of large and small scattered trees is determined as follows:

- Large scattered tree the area of a circle with a 15-metre radius, with the trunk of the tree at the centre.
- Small scattered tree the area of a circle with a ten-metre radius, with the trunk of the tree at the centre.

The assessment pathway for assessing an application to remove native vegetation is then determined as detailed in the following matrix table:

| Extent of notive vegetation | Location Category | | | | |
|--|-------------------|--------------|------------|--|--|
| Extent of native vegetation | Location 1 | Location 2 | Location 3 | | |
| < 0.5 hectares and not including any large trees | Basic | Intermediate | Detailed | | |
| < 0.5 hectares and including one or more large trees | Intermediate | Intermediate | Detailed | | |
| ≥ 0.5 hectares | Detailed | Detailed | Detailed | | |

Note: If the native vegetation to be removed includes more than one location category, the higher location category is used to determine the assessment pathway.

Landscape scale information – strategic biodiversity value

The strategic biodiversity value (SBV) is a measure of a location's importance to Victoria's biodiversity, relative to other locations across the state. This is represented as a score between 0 and 1 and determined from the Strategic biodiversity value map, available from *NVIM* (DELWP 2021c).

Landscape scale information – habitat for rare or threatened species

Habitat importance for rare or threatened species is a measure of the importance of a location in the landscape as habitat for a particular rare or threatened species, in relation to other habitat available for that species. It is represented as a score between 0 and 1 and is determined from the Habitat importance maps, administered by DELWP.

This includes two groups of habitat:

- **Highly localised habitats** Limited in area and considered to be equally important, therefore having the same habitat importance score.
- **Dispersed habitats** Less limited in area and based on habitat distribution models.

Habitat for rare or threatened species is used to determine the type of offset required in the detailed assessment pathway.

Biodiversity value

A combination of site-based and landscape-scale information is used to calculate the biodiversity value of native vegetation to be removed. Biodiversity value is represented by a general or species habitat score, detailed as follows.

Firstly, the extent and condition of native vegetation to be removed are combined to determine the habitat hectares as follows:

Habitat hectares = extent of native vegetation x condition score

Secondly, the habitat hectare score is combined with a landscape factor to obtain an overall measure of biodiversity value. Two landscape factors exist as follows:

- General landscape factor determined using an adjusted strategic biodiversity score, and relevant when no habitat importance scores are applicable;
- Species landscape factor determined using an adjusted habitat importance score for each rare or threatened species habitat mapped at a site in the Habitat importance map.

These factors are subsequently used as follows to determine the biodiversity value of a site:

General habitat score = habitat hectares x general landscape factor

Species habitat score = habitat hectares x species landscape factor

Offset requirements

A native vegetation offset is required for the approved removal of native vegetation. Offsets conform to one of two types and each type incorporates a multiplier to address the risk of offset:

• A **general offset** is required when the removal of native vegetation does not have a significant impact on any habitat for rare or threatened species (i.e. the proportional impact is below the species offset threshold). In this case a multiplier of 1.5 applies to determine the general offset amount.

General offset (amount of general habitat units) = general habitat score x 1.5

 A species offset is required when the removal of native vegetation has a significant impact on habitat for a rare or threatened species (i.e. the proportional impact is above the species offset threshold). In this case a multiplier of 2 applies to determine the species offset quantity.

Species offset (amount of species habitat units) = Species habitat score x 2

Note: if native vegetation does not meet the definition of either a patch or scattered tree an offset is not required.

Offset attributes

Offsets must meet the following attribute requirements, as relevant:

- General offsets
 - Offset amount general offset = general habitat score x 1.5
 - Strategic biodiversity value (SBV) the offset has at least 80% of the SBV of the native vegetation removed

- Vicinity the offset is in the same CMA boundary or municipal district as the native vegetation removed
- Habitat for rare and threatened species N/A
- Large trees the offset include the protection of at least one large tree for every large tree to be removed
- Species offsets
 - **Offset amount** species offset = species habitat score x 2
 - Strategic biodiversity value (SBV): N/A
 - Vicinity: N/A
 - Habitat for rare and threatened species the offset comprises mapped habitat according to the Habitat importance map for the relevant species
 - Large trees the offset include the protection of at least one large tree for every large tree to be removed

EVC/Bioregion Benchmark for Vegetation Quality Assessment Gippsland Plain bioregion

EVC 55: Plains Grassy Woodland

Description:

An open, eucalypt woodland to 15 m tall occurring on a number of geologies and soil types. Occupies poorly drained, fertile soils on flat or gently undulating plains at low elevations. The understorey consists of a few sparse shrubs over a species-rich grassy and herbaceous ground layer.

EVC/Bioregion Benchmark for Vegetation Quality Assessment

Gippsland Plain bioregion

EVC 53_61: Swamp Scrub

Description:

Closed scrub to 8 m tall at low elevations on alluvial deposits along streams or on poorly drained sites with higher nutrient availability. The EVC is dominated by Swamp Paperbark *Melaleuca ericifolia* (or sometimes Woolly Tea-tree *Leptospermum lanigerum*) which often forms a dense thicket, out-competing other species. Occasional emergent eucalypts may be present. Where light penetrates to ground level, a moss/lichen/liverwort or herbaceous ground cover is often present. Dry variants have a grassy/herbaceous ground layer.

This report provides information to support an application to remove, destroy or lop native vegetation in accordance with the *Guidelines for the removal, destruction or lopping of native vegetation*. The report **is not an assessment by DELWP** of the proposed native vegetation removal. Native vegetation information and offset requirements have been determined using spatial data provided by the applicant or their consultant.

| Date of issue: Time of issue: | | Report ID: NAA_2021_125 |
|----------------------------------|-------------------------|-------------------------|
| Project ID | 20138_Solar_Remo_210913 | |

Assessment pathway

| Assessment pathway | Detailed Assessment Pathway |
|--|--|
| Extent including past and proposed | 27.879 ha |
| Extent of past removal | 0.000 ha |
| Extent of proposed removal | 27.879 ha |
| No. Large trees proposed to be removed | 0 |
| Location category of proposed removal | Location 2 The native vegetation is in an area mapped as an endangered Ecological Vegetation Class (as per the statewide EVC map). Removal of less than 0.5 hectares of native vegetation in this location will not have a significant impact on any habitat for a rare or threatened species. |

1. Location map

Page 1

Offset requirements if a permit is granted

Any approval granted will include a condition to obtain an offset that meets the following requirements:

| General offset amount ¹ | 8.181 general habitat units | | | | | |
|---|---|--|--|--|--|--|
| Vicinity | West Gippsland Catchment Management Authority (CMA) or Wellington Shire Council | | | | | |
| Minimum strategic biodiversity value score ² | 0.373 | | | | | |
| Large trees | 0 large trees | | | | | |

NB: values within tables in this document may not add to the totals shown above due to rounding

Appendix 1 includes information about the native vegetation to be removed

Appendix 2 includes information about the rare or threatened species mapped at the site.

Appendix 3 includes maps showing native vegetation to be removed and extracts of relevant species habitat importance maps

¹ The general offset amount required is the sum of all general habitat units in Appendix 1.

² Minimum strategic biodiversity score is 80 per cent of the weighted average score across habitat zones where a general offset is required

Next steps

Any proposal to remove native vegetation must meet the application requirements of the Detailed Assessment Pathway and it will be assessed under the Detailed Assessment Pathway.

If you wish to remove the mapped native vegetation you are required to apply for a permit from your local council. Council will refer your application to DELWP for assessment, as required. **This report is not a referral assessment by DELWP**.

This *Native vegetation removal report* must be submitted with your application for a permit to remove, destroy or lop native vegetation.

Refer to the *Guidelines for the removal, destruction or lopping of native* vegetation (the Guidelines) for a full list of application requirements This report provides information that meets the following application requirements:

- The assessment pathway and reason for the assessment pathway
- A description of the native vegetation to be removed (partly met)
- Maps showing the native vegetation and property (partly met)
- Information about the impacts on rare or threatened species.
- The offset requirements determined in accordance with section 5 of the Guidelines that apply if approval is granted to remove native vegetation.

Additional application requirements must be met including:

- Topographical and land information
- Recent dated photographs
- Details of past native vegetation removal
- An avoid and minimise statement
- A copy of any Property Vegetation Plan that applies
- A defendable space statement as applicable
- A statement about the Native Vegetation Precinct Plan as applicable

- A site assessment report including a habitat hectare assessment of any patches of native vegetation and details of trees
- An offset statement that explains that an offset has been identified and how it will be secured.

Notwithstanding anything else contained in this publication, you must ensure that you comply with all relevant laws, legislation, awards or orders and that you obtain and comply with all permits, approvals and the like that affect, are applicable or are necessary to undertake any action to remove, lop or destroy or otherwise deal with any native vegetation or that apply to matters within the scope of Clauses 52.16 or 52.17 of the Victoria Planning Provisions and Victorian planning schemes.

www.delwp.vic.gov.au

Appendix 1: Description of native vegetation to be removed

The species-general offset test was applied to your proposal. This test determines if the proposed removal of native vegetation has a proportional impact on any rare or threatened species habitats above the species offset threshold. The threshold is set at 0.005 per cent of the mapped habitat value for a species. When the proportional impact is above the species offset threshold a species offset is required. This test is done for all species mapped at the site. Multiple species offsets will be required if the species offset threshold is exceeded for multiple species.

Where a zone requires species offset(s), the species habitat units for each species in that zone is calculated by the following equation in accordance with the Guidelines:

Species habitat units = extent x condition x species landscape factor x 2, where the species landscape factor = 0.5 + (habitat importance score/2)

The species offset amount(s) required is the sum of all species habitat units per zone

Where a zone does not require a species offset, the general habitat units in that zone is calculated by the following equation in accordance with the Guidelines:

General habitat units = extent x condition x general landscape factor x 1.5, where the general landscape factor = 0.5 + (strategic biodiversity value score/2)

The general offset amount required is the sum of all general habitat units per zone.

Appendix 2: Information about impacts to rare or threatened species' habitats on site

This table lists all rare or threatened species' habitats mapped at the site.

| Species common name | Species scientific name | Species number | Conservation status | Group | Habitat impacted | % habitat value affected |
|------------------------------|---|-------------------|------------------------|-----------|------------------------|--------------------------|
| Rough-grain Love-grass | Eragrostis trachycarpa | 501197 | Rare | Dispersed | Habitat importance map | 0.0004 |
| Veiled Fringe-sedge | Fimbristylis velata | 501369 | Rare | Dispersed | Habitat importance map | 0.0003 |
| Grey Billy-buttons | Craspedia canens | 504643 | Endangered | Dispersed | Habitat importance map | 0.0002 |
| Small Scurf-pea | Cullen parvum | 502773 | Endangered | Dispersed | Habitat importance map | 0.0002 |
| Maroon Leek-orchid | Prasophyllum frenchii | 502709 | Endangered | Dispersed | Habitat importance map | 0.0002 |
| Wavy Swamp Wallaby- grass | Amphibromus sinuatus | 503625 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Matted Flax-lily | Dianella amoena | 505084 | Endangered | Dispersed | Habitat importance map | 0.0001 |
| Annual Fireweed | Senecio glomeratus subsp. longifructus | 507144 | Rare | Dispersed | Habitat importance map | 0.0001 |
| Leafy Twig-sedge | Cladium procerum | 500786 | Rare | Dispersed | Habitat importance map | 0.0001 |
| Purple Blown-grass | Lachnagrostis punicea subsp. punicea | 504206 | Rare | Dispersed | Habitat importance map | 0.0001 |
| Pale Swamp Everlasting | Coronidium gunnianum | 504655 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Purple Blown-grass | Lachnagrostis punicea subsp. filifolia | 504222 | Rare | Dispersed | Habitat importance map | 0.0001 |
| Purple Diuris | Diuris punctata | 501084 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Swamp Everlasting | Xerochrysum palustre | 503763 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Trailing Hop-bush | Dodonaea procumbens | 501090 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Woolly Waterlily | Philydrum lanuginosum | 502494 | Vulnerable | Dispersed | Habitat importance map | 0.0001 |
| Growling Grass Frog | Litoria raniformis | 13207 | Endangered | Dispersed | Habitat importance map | 0.0001 |
| Lacey River Buttercup | Ranunculus amplus | 505019 | Rare | Dispersed | Habitat importance map | 0.0000 |

| Lewin's Rail | Lewinia pectoralis pectoralis | 10045 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |
|---------------------------|---|--------|------------|-----------|------------------------|--------|
| Salt Lawrencia | Lawrencia spicata | 501888 | Rare | Dispersed | Habitat importance map | 0.0000 |
| Silky Kidney-weed | Dichondra sp. 1 | 505786 | Rare | Dispersed | Habitat importance map | 0.0000 |
| Tall Vanilla-lily | Arthropodium sp. 1 (robust glaucous) | 503699 | Rare | Dispersed | Habitat importance map | 0.0000 |
| Forest Bitter-cress | Cardamine papillata | 505034 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |
| Lanky Buttons | Leptorhynchos elongatus | 501941 | Endangered | Dispersed | Habitat importance map | 0.0000 |
| Spurred Helmet-orchid | Corybas aconitiflorus | 500835 | Rare | Dispersed | Habitat importance map | 0.0000 |
| Black Falcon | Falco subniger | 10238 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |
| Australian Little Bittern | Ixobrychus dubius | 10195 | Endangered | Dispersed | Habitat importance map | 0.0000 |
| Australasian Bittern | Botaurus poiciloptilus | 10197 | Endangered | Dispersed | Habitat importance map | 0.0000 |
| Austral Crane's-bill | Geranium solanderi var. solanderi s.s. | 505337 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |
| Baillon's Crake | Porzana pusilla palustris | 10050 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |
| Australasian Shoveler | Anas rhynchotis | 10212 | Vulnerable | Dispersed | Habitat importance map | 0.0000 |

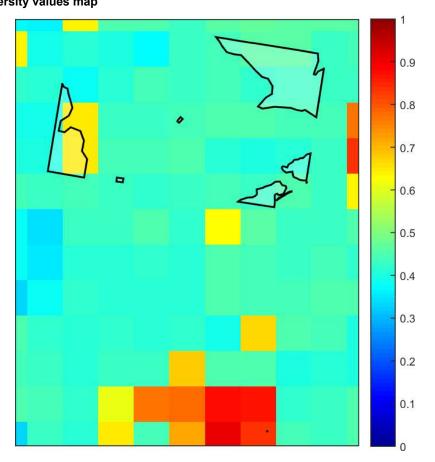

Habitat group

- Highly localised habitat means there is 2000 hectares or less mapped habitat for the species
- Dispersed habitat means there is more than 2000 hectares of mapped habitat for the species

Habitat impacted

- Habitat importance maps are the maps defined in the Guidelines that include all the mapped habitat for a rare or threatened species
- Top ranking maps are the maps defined in the Guidelines that depict the important areas of a dispersed species habitat, developed from the highest habitat importance scores in dispersed species habitat maps and selected VBA records
- Selected VBA record is an area in Victoria that represents a large population, roosting or breeding site etc.

Appendix 3 – Images of mapped native vegetation 2. Strategic biodiversity values map

3. Aerial photograph showing mapped native vegetation

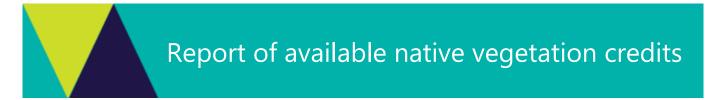

4. Map of the property in context

Yellow boundaries denote areas of proposed native vegetation removal.

This report lists native vegetation credits available to purchase through the Native Vegetation Credit Register.

This report is **not evidence** that an offset has been secured. An offset is only secured when the units have been purchased and allocated to a permit or other approval and an allocated credit extract is provided by the Native Vegetation Credit Register.

Date and time: 10/11/2021 10:18

Report ID: 11756

These sites meet your requirements for general offsets.

These sites meet your requirements using alternative arrangements for general offsets.

| Credit Site ID | GHU | LT CMA | LGA | Land | Trader | Fixed | Broker(s) |
|----------------|-----|--------|-----|-------|--------|-------|-----------|
| | | | | owner | | price | |

There are no sites listed in the Native Vegetation Credit Register that meet your offset requirements when applying the alternative arrangements as listed in section 11.2 of the Guidelines for the removal, destruction or lopping of native vegetation.

These potential sites are not yet available, land owners may finalise them once a buyer is confirmed.

| Credit Site ID | GHU | LT CMA | LGA | Land | Trader | Fixed | Broker(s) |
|----------------|-----|--------|-----|-------|--------|-------|-----------|
| | | | | owner | | price | |

There are no potential sites listed in the Native Vegetation Credit Register that meet your offset requirements.

LT - Large Trees

CMA - Catchment Management Authority

LGA - Municipal District or Local Government Authority

Next steps

If applying for approval to remove native vegetation

Attach this report to an application to remove native vegetation as evidence that your offset requirement is currently available.

If you have approval to remove native vegetation

Below are the contact details for all brokers. Contact the broker(s) listed for the credit site(s) that meet your offset requirements. These are shown in the above tables. If more than one broker or site is listed, you should get more than one quote before deciding which offset to secure.

| NO LTS | Site Condition Score | |

| Large Trees | Sco | re | 0 |
|--|-------|-----------|-------|
| Category & Description | % | Сапору Не | alth* |
| | > 70% | 30-70% | < 30% |
| None present | 0 | 0 | 0 |
| > 0 to 20% of the benchmark number of large trees/ha | 3 | 2 | 1 |
| > 20% to 40% of the benchmark number of large trees/ha | 4 | 3 | 2 |
| > 40% to 70% of the benchmark number of large trees/ha | 6 | 5 | 4 |
| > 70% to 100% of the benchmark number of large trees/ha | 8 | 7 | 6 |
| ≥ the benchmark number of large trees/ha | 10 | 9 | 8 |

Large trees are defined by diameter at breast height (dbh)

- see EVC benchmark.

* Estimate proportion of an expected healthy canopy cover that is present

(i.e. not missing due to tree death or decline, or mistletoe infestation).

| NO CANO, | PY | | · |
|--|-------|--------|-------|
| Tree Canopy Cover | Sco | re | 0 |
| Category & Description | % (| alth * | |
| | > 70% | 30-70% | < 30% |
| < 10% of benchmark cover | 0 | 0 | 0 |
| < 50% or > 150% of benchmark cover | 3 | 2 | 1 |
| \geq 50% or \leq 150% of benchmark cover | 5 | 4 | 3 |

Tree canopy is defined as those canopy tree species reaching \ge 80% of mature height - see EVC benchmark description.

* Estimate proportion of an expected healthy canopy cover that is present

(i.e. not missing due to tree death or decline, or mistletoe infestation).

| Lack of Weeds | Sca | ore | 2/ |
|-------------------------|------|---------------|-------------|
| Category & Description | 'hig | gh threat' we | eds* |
| category & Description | None | ≤ 50% | > 50% |
| > 50% cover of weeds | 4 | 2 | 0 |
| 25 - 50% cover of weeds | 7 | 6 | (4) |
| 5 - 25% cover of weeds | 11 | 9 | \subseteq |
| < 5% cover of weeds** | 15 | 13 | 11 |

* proportion of weed cover due to 'high threat' weeds - see EVC benchmark for guide. 'High threat' weed species are defined as those introduced species (including non-indigenous 'natives') with the ability to out-compete and substantially reduce one or more indigenous life forms in the longer term assuming on-going current site characteristics and disturbance regime.

The EVC benchmark lists typical weed species for the EVC in the bioregion and provides an estimate of their 'invasiveness' and 'impact'. In general, those weed species considered to have a *high impact* are considered *high threat* regardless of their invasiveness.

** if total weed cover is negligible (<1%) and high threat weed species are present then score '13'.

present

< 5% cover of weeds** 15 13 * proportion of weed cover due to 'high threat' weeds - see EVC benchmark for guide. 'High threat' weed species are defined as those introduced species (including non-indigenous 'natives') with the ability to out-compete and substantially reduce one or more indigenous life forms in the longer term assuming on-going current site characteristics and disturbance regime.

The EVC benchmark lists typical weed species for the EVC in the bioregion and provides an estimate of their 'invasiveness' and 'impact'. In general, those weed species considered to have a *high impact* are considered *high threat* regardless of their invasiveness.

** if total weed cover is negligible (<1%) and high threat weed species are present then score '13'.
